## ACKNOWLEDGEMENTS

I would like to offer my sincere thank you to my first supervisor, Professor Sabbir Ahmed and my second supervisor, Dr Caroline Owen without whom this PhD would have not been possible. I will be forever grateful to them for all their help, effort, patience, guidance and support.

A huge thank you to Dr Michael Tsang for his help, and all the other technicians, and to all my colleagues and friends in the research laboratory EM211/212, in particular, Jean-Marie for his assistance with NMR and laboratory issues. A big thank you to Sachin Dhanani for the biochemical testing of my compounds and also Patric Helbig, for his assistance.

I would also like to thank my family (my mum, Jas and Guru dad in particular) and my close friends especially Huria (won't forget those long hours we did), Rina, Moni and K for their support, patience and guidance during the bad and the good times during this period, as they have been there for me and been my pillars of strength. Also, a huge thank you to Kingston University for giving me the opportunity to study here. Last but not least, thank you God for looking out for me and also giving me the strength and determination to make my dream come true.

#### Abstract

The biosynthesis of sex steroids is undertaken by a number of important enzymes such as aromatase, 17 $\beta$-hydroxysteroid dehydrogenase (types 1 and 3) and estrone sulfatase (ES). Through the inhibition of these enzymes it is possible to reduce the amount of steroids present, which in turn reduces the stimulation of hormone-dependent tissues including breast and prostate cancer cells. Within the current study of my project, we have undertaken the synthesis and limited biochemical evaluation of a number of compounds of varying structural features and which were synthesised as potential enzyme inhibitors in treatment of hormone-dependent cancers. As such, a series of compounds based on the two compounds below were synthesised.  (a)  (b)

Compounds based upon structure (a) were synthesised where $\mathrm{R}=\mathrm{OH}$ and $\mathrm{R}_{1}=a l k y l$ chain or cycloalkyl moiety and evaluated against $17 \beta$-HSD1 and $17 \beta-$ HSD3. The results show that the 4 -hydroxyphenyl ketone-based compounds were found to be highly potent against type 3 in comparison to type $17 \beta$-HSD1. For example, 1-(4-hydroxy-phenyl)-nonan-1-one (165) was found to possess inhibitory activity of $83.53 \pm 0.48 \%$ (at $[1]=100 \mu \mathrm{M}$ ) ( $\mathrm{IC}_{50}$ of $2.86 \pm 0.03 \mu \mathrm{M}$ ) against $17 \beta$-HSD3. Under similar conditions, 165 was found to possess inhibitory activity of $36.32 \pm 0.33 \%$ (at []$]=100 \mu \mathrm{M}$ ) against type1. A range of compounds were also synthesised based on biphenyl ketones where $\mathrm{R}=$ phenyl ring and $\mathrm{R}_{1}=$ alkyl chain or cycloalkyl moiety. These compounds were found to be weaker inhibitors of 173-HSD3 (in comparison to the 4 -hydroxyphenyl ketones), however, interestingly they were found to possess greater inhibitory activity against 17ßHSD1. In an effort to determine the selectivity of these compounds against the overall class of HSD enzymes, all inhibitors were evaluated for inhibitory activity against an alternative member of the family of HSD enzymes, namely $3 \beta$ hydroxysteroid dehydrogenase ( $3 \beta-H S D$ ). In general, the synthesised compounds were found to possess weak inhibitory activity against $3 \beta$-HSD at inhibitor concentration of $100 \mu \mathrm{M}$ and $500 \mu \mathrm{M}$. Derivatives of 4 -hydroxyphenyl ketones were synthesised (for example, containing sulfamate or methanesulfonate groups substituted at the para position of the phenyl ketones), however, due to the end of the project, they were not evaluated for inhibitory activity against $17 \beta$-HSD1 and 3 or against $3 \beta-$ HSD.

The synthesis of a series of potential inhibitors of ES based on esters of 4hydroxybenzoic acid [b] were attempted, however, due to severe problems related to the stability of the final sulfamate derivative, the final compounds were not synthesised and only the alkyl and cycloalkyl esters of 4-hydroxybenzoic acid are reported in the current report.

## CHAPTER 1

## Introduction

### 1.0 INTRODUCTION

### 1.1 Cancer

There are roughly more than 100 different types of cancers present, which could emerge in various ways, and forming many distinct subtypes in each affected organ. Factors that aid the progression of the rate and scope of the tumour include biological, immunological, environmental and genetic factors (Jefford and Irminger-Finger, 2006). It is one of the major causes of death in developed countries; it will affect one in three in the population at some time of their life, and in Europe, there are 2.9 million new cases and 1.7 million deaths from the disease each year (Boyle and Ferlay, 2005). Also as the elderly population increase, the incidence of cancer will continue to increase (Quinn et al, 2003).

There are six main physiological changes that consist of novel capabilities acquired during tumour development. These include self-sufficiency in growth signals, insensitivity to growth inhibitory signals, evasion of programmed cell death (apoptosis), limitless potential to replicate, persistent angiogenesis, and metastasis via tissue invasion (Jefford and Irminger-Finger, 2006).

### 1.2 Breast cancer

Other than lung and large bowel cancer, breast cancer is the most common type of cancer amongst women, and the number that is diagnosed with breast cancer is about 180,000 each year. In Western countries such as Europe, USA, Canada and South America, 25-30\% of the total incidence of cancers in women are represented by breast cancers, and accounts for 15-18\% of mortality (Pasqualini, 2004).

Two-thirds of breast cancers are detected in postmenopausal women, and the life-time risk of a woman developing breast cancer is 1 in 8 in the United States, 1 in 12 in Europe and 1 in 80 in Japan (Pasqualini, 2004). Breast
cancer is one of the most prevalent types of cancer, and epidemiological and clinical studies have shown that approximately two-thirds of breast tumours are estrogen-dependent (Henderson and Cannellos, 1980).

### 1.2.1 Causes of breast cancer

The exact causes of breast cancer are not known, but studies have shown that the risk of breast cancer increases with age. This disease is very uncommon in those under the age of 35 , and most breast cancers occur over the age of 50 , and the risk is especially high for women over the age of 60 . The factors believed to be involved in increasing the chance of developing breast cancer are explained briefly in Table 1a below:

| Risk factor | Explanation |
| :---: | :---: |
| Family history | Risk is increased if a family member, <br> for example a mother or sister has <br> had breast cancer. |
| Diet | Dietary fat increases the risk. |
| Radiation therapy | X-rays etc are known to increase the <br> risk of breast cancer. |
| Breast density | Breast cancers occur in dense <br> tissue and not in fatty tissue. |
| Late childbearing | Risk is increased as longer <br> exposure to estrogens. |
| Age of menarche | Early menstruation and late meno- <br> pause increases the chance of <br> breast cancer. |
| Geographical location | Risk is increased for women in <br> developed countries compared to <br> developing countries. |
| Alcohol | Studies have shown that this <br> increases the risk. |

Table 1a: Table showing the risk factors associated with breast cancer.

### 1.2.2 Breast Cancer and Estrogens

Breast cancer can be divided into two sub-types, namely hormone-dependent and hormone-independent. In the former case, the cancer depends on hormones for growth, i.e. estrogen stimulation (Santen et al, 1990). About $95 \%$ of breast cancers are hormone-dependent initially, whether they occur in pre- or postmenopausal women, whereby the more potent estrogen, estradiol (E2) plays a very important role in the development and progression of the cancer (Pasqualini, 2004).

Estrogens are produced by the granulosa cells in the ovary as a result of stimulation by follicle stimulating hormone (FSH) from androgen precursor molecules, which are themselves derived from thecal cells stimulated by luteinising hormone (LH). Estrogens are also produced in moderate quantity by the placenta and in small amounts by the testis in males and by the adrenal cortex in both sexes. Some other tissues, such as the liver, muscle, fat and hair follicles, can also convert steroid precursors into estrogens.

Roles of estrogens include stimulating the maturation in females during puberty, development of the breast and maintaining the normal structure of skin and blood vessels (Green et al, 1993).

In the management of breast cancer, hormone-receptors are widely accepted as prognostic and therapeutic tools. The expression of estrogen-receptors (ERs) is thought to be of great importance due to the fact that majority of all breast cancers are ER-positive (ER+) and progesterone receptor (PR)positive ( $\mathrm{PR}+$ ), hence making these tumours acquiescent to treatment with adjuvant hormonal therapy. Nearly $33 \%$ of breast cancers are hormoneinsensitive, whereby they lack both ER and PR. These tumours are more common among younger breast cancer patients. ER- tumours characteristically have a poor prognosis, and they do not respond to conventional hormone therapies (Pommier et al, 2006).

### 1.2.3 Estrogen Synthesis

The starting substance for steroid biosynthesis is cholesterol (Figure 1.1). The immediate precursors to estrogens are androgenic substances androstenedione or testosterone. There are three main endogenous estrogens in humans namely estrone ( E 1 ), estradiol (E2), and estriol (E3). E2 is the principle estrogen secreted by the ovary, and is the most potent.

In post-menopausal women, there is also found to be a high level of circulating estrone sulphate. Estrone sulfate is probably the principle estrogen reservoir, since its levels are known to be 8 - to 10 -fold higher than those of free estrone. Breast tissue concentrations of estrone sulfatase (the enzyme that converts estrone sulfate to estrone) are 1000-fold higher than those of aromatase (Noel et al, 1981; Samojlik et al, 1982; James et al, 1987; Pasqualini et al, 1986).

Figure 1.1: Diagram showing steroid biosynthesis (Rang et al, 1998), where HSD=Hydroxysteroid dehydrogenase, AR=Aromatase, OHase=hydroxylase, ES=Estrone sulfatase, ESTF=Estrone sulfotransferase.

### 1.3 Therapies for Breast Cancer

There have been many therapies developed for the treatment of breast cancer. The type of treatment used depends on the stage of the tumour and these are shown in Table ib below.

| Therapy | Method of treatment |
| :---: | :---: |
| Surgery | Lumpectomy or mastectomy. |
| Radiotherapy | Use of ionising rays. |
| Chemotherapy | Use of for example alkylating agents <br> such as cyclophosphamide that <br> interfere with DNA strands and hence <br> stop transcription. |
| Hormonal therapy | Use of anti-estrogens for example <br> tamoxifen or an aromatase inhibitor <br> such as Letrozole. |
| Gene therapy | Insertion of normal gene into non- <br> specific location, within the genome to <br> replace the non-functional gene. |
| Immunotherapy | Use of monoclonal antibodies for <br> example Rituximab, to specifically <br> target cells. |

Table 1b: Table showing the types of treatments available for breast cancer.

Hormonal therapy can be used in all stages of hormone-dependent breast cancer (Osborne et al, 1980) and those most currently in use involve either a reduction in levels of stimulating hormones in the body or the prevention of their stimulatory effects.

Hormonal therapy is a vital part of the management of most women with breast cancer regardless of whether it is in the localised (primary) or metastatic (secondary) stages. A number of hormonal agents are clinically in
use, including antiestrogens (e.g. tamoxifen), progestins, androgens, estrogens, luteinising hormone-releasing hormone (LH-RH) analogues and enzyme inhibitors (Ingle et al, 1999). Another method used in an attempt to prevent the stimulation of breast cancer by estrogens is by surgical removal of the ovaries (oophorectomy).

### 1.3.1 Hormonal therapy via inhibition of estrogens

Blockade of the terminal steps in estrogen biosynthesis is the preferred strategy, preventing the inhibition of production of other important steroids (Santen et al, 1999). There are three main enzyme complexes involved in estrogen synthesis in breast tumours, namely; Aromatase (AR) - which converts androgens to estrogens, 17beta-hydroxysteroid dehydrogenase (17 $\beta$-HSD) - which transforms E1 into its biologically active form, E2 and finally Estrone sulfatase (ES) - which hydrolyses estrone sulfate to E1 (Figure 1.2). Each of these enzymes has been targeted in an attempt to reduce the levels of stimulating estrogens. At present, estrogen synthesis inhibitors are used as a second-line therapy, but an AR inhibitor, anastrozole, is now thought to be more effective than tamoxifen (the first-line treatment for women with advanced breast cancer) and will replace it soon as first-line therapy.

Figure 1.2: Enzymes involved in estrogen synthesis.

### 1.4 Hydroxysteroid dehydrogenases (HSDs)

HSDs are responsible for the pre-receptor regulation of steroid hormone action (Morris et al., 2003), and they do so by converting steroids at positions $3,5,11,17$ and 20 of the steroid backbone.

### 1.4.1 17 $\beta$-HSDs

Steroid hormone activation and deactivation is carried out by $17 \beta$-HSDs. The family of $17 \beta$-HSDs, which by conversion at position 17, modulate biological potency of estrogens and androgens; the keto-forms being inactive, whereas the hydroxy-forms are active and these access the receptors (Mindnich et al, 2004) (Figure 1.3).

There are different isozymes of $17 \beta$-HSDs known. They are coded by different amino acid (aa) sequences revealing different subcellular localisations, as well as cofactor and substrate preferences. 17 $\beta$-HSDs belong to two protein super families; namely the short chain dehydrogenase/reductase (SDR) and aldo-ketoreductase (AKR) (Oppermann et al, 1999; Penning, 2003).

Figure 1.3: The action of $17 \beta-$ HSD on estrogens and androgens by redox reactions at position 17 (Mindnich et al, 2003).

At present, fourteen forms of $17 \beta$-HSDs are known, most of which are members of the SDR protein superfamily. Not all known $17 \beta$-HSD forms are present in every species, 12 types are found in humans, $17 \beta$-HSD types 6 and 9 being found in rodents so far. One exception is $17 \beta$-HSD type 5 that belongs to the AKR-family. These isozymes utilise nicotinamide adenine (phosphate) nucleotides $\operatorname{NAD}(\mathrm{P})(\mathrm{H})$ as cofactors for reduction or oxidation reactions of steroids (Adamski et al, 2003).

SDRs are mainly multimeric enzymes, with a monomer mass of about 30 kDa , and these transfer the pro-S-hydride ion from the cofactor to the steroid, whereas AKRs are monomeric, with a monomer molecular mass of around 37 kDa , and these transfer the 4 -pro- $R$-hydride ion from the cofactor to the steroid substrate (Mindnich et al, 2004).

It was observed by Ryan and Engel (1953), that E1 and E2 were metabolised by human tissues, and shortly after that, Langer and Engel (1958) described the first partial purification of $17 \beta$-HSD from human placenta.
$17 \beta$-HSD type 1 ( $17 \beta$-HSD1) contributes towards breast cancer and its main involvement is in the role of E2 synthesis via the reduction of E1 and is expressed mainly in the placenta, ovary and breast (Poirier and Tremblay, 1998). It is also expressed in carcinoma in situ and invasive ductal carcinoma. In addition, its co-expression was positively correlated with estrogen receptor status in invasive ductal carcinoma cases. These results indicate that breast carcinoma can effectively convert E1 to active E2 and thus exerts estrogenic actions on tumour cells through the estrogen receptor (Gunnarson et al, 2001). 17ß-HSD1 also catalyses the conversion of DHEA to $\Delta 5$-androstene$3 \beta, 17 \beta$-diol ( $\Delta 5$-diol).
$17 \beta$-HSD2 is mainly expressed in the breast, endometrium, placenta, liver, small intestine, kidney, pancreas and colon (Blomquist et al, $1985^{\text {b }}$ ) and plays a major role in the inactivation of potent steroid hormones by oxidising E2 and
testosterone (T) to E1 and androstenedione (AD) respectively (Wu et al, 1993). These reactions can occur in virtually all tissues (Peltoketo et al, 1999).
$17 \beta$-HSD3 and $17 \beta$-HSD4 are expressed in the testis and in peripheral tissues respectively (Poirier and Tremblay, 1998). The reduction of AD to T is catalysed by $17 \beta$-HSD3, whereas $17 \beta$-HSD4 catalyses the conversion of $\Delta 5$ diol to DHEA (Adamski et al, 1995, Labrie et al, 2000) and the oxidation (inactivation) of E2.

T formation from AD is catalysed by $17 \beta$-HSD5 (Lin et al, 1997; Rheault et al, 1999 ) and it catalyses the conversion of DHEA to $\Delta 5$-diol.
$17 \beta$-HSD8 catalyses the oxidation of E2 and $17 \beta$-HSD2 and $17 \beta$-HSD8 might be involved in the catalysis of $T$ oxidation (Andersson and Moghrabi, 1997; Fomitcheva et al, 1998). $5 \alpha$-Reductase reduces T at position 5 to produce the potent androgen DHT. DHT may undergo reduction at position 3 to form the weak androgen $5 \alpha$-androstane- $3 \alpha, 17 \beta$-diol, and if that is the case, then the reaction might be catalysed by $17 \beta$-HSD5, 7 and 10 as well as $3 \alpha-$ hydroxysteroid dehydrogenases (Penning et al, 2001; Törn et al, 2003).
$17 \beta$-HSD10 also carries out the oxidation of E2 and is found universally (Adamski et al, 1995; Fomitcheva et al, 1998; He et al, 1999; Vihko et al, 2001; Wu et al, 1993). 17 $\beta$-HSD13 activity has not been demonstrated as yet, and $17 \beta$-HSD14 is expressed in the kidney and in the central nervous system and is involved in E2 and T inactivation (Lukacik et al, 2006).

Table 1c shows a summary of some of the isozymes, their function and the disease pathology.

| Enzyme type | Human function | Disease or participation in pathology |
| :---: | :---: | :---: |
| 17ß-HSD1 | E2 synthesis | Breast and prostate cancer |
| 173-HSD2 | E2 and T inactivation | Endometriosis, colon and prostate cancer |
| 173-HSD3 | T synthesis | Pseudohermaphroditism |
| 17 $\beta$-HSD4 | E2 inactivation and androgen metabolism | D-specific multifunctional protein deficiency |
| 173-HSD5 | T synthesis | Not known |
| 17ß-HSD6 (known in rats only) | Not known | Not known |
| 173-HSD7 | E2 synthesis | Not known |
| 173-HSD8 | Estrogen and androgen inactivation | Not known |

| 17 $\beta$-HSD11 | Estrogen and androgen inactivation | Not known |
| 17ß-HSD 12 | Fatty acid synthesis | Not known |
| 17ß-HSD 13 | Not known | Not known |
| 17 $\beta$-HSD 14 | E2 and T inactivation | Not known |

Table 1c: Table showing the different forms of $17 \beta$-HSD (Mindnich et al, 2004).

### 1.4.2 Mechanism for $17 \beta$-HSDs

The chemical mechanism for HSDs was revealed by site-directed mutagenesis, whereby seven active site mutants namely; Y55F, Y55S, H117A, D50N, D50E, K84R and K84M were over expressed and purified to
homogeneity from E. coli (Pawlowski and Penning, 1994; Schlegel et al, 1998). All mutants formed the binary complex E.NADPH unimpeded (Penning et al, 1999).

The mechanism of action of the $17 \beta$-HSD family of enzymes is thought to occur in two ways, and involves either an oxidative or a reductive mechanism. The reductive catalytic mechanism is shown in Figure 1.4.

Figure 1.4: Catalytic Mechanism for $17 \beta$-HSD via the reductive route (Penning et al, 1999).

In the reductive mechanism, histamine ( H 117 ) aids proton donation by tyrosine (Y55). Y55 donates it proton to the acceptor carbonyl group of the steroid. The tyrosyl hydroxyl group of the imidazole ring of H117 undergoes protonation (Penning et al, 1999).

The oxidative catalytic mechanism, on the other hand is shown in Figure 1.5.

OXIDATION pH optimum $=9.0$

Figure 1.5: The catalytic mechanism of $17 \beta-H S D$ via the oxidative route. (Penning et al, 1999)

In the oxidation step, the amino group of K84 aids proton removal by Y55, and forms a phenolate anion on Y55. Hydride transfer is facilitated from the steroid alcohol (Penning et al, 1999).

### 1.4.3 Enzyme structure

$17 \beta-H S D 1$ belongs to the SDR family, and requires a Tyr-X-X-X-Lys motif and a Tyr-Lys-Ser catalytic triad for activity (Ghosh et al, 1995; and Ghosh et al, 1994).

An example of how binding occurs at the catalytic site of the enzyme, the structure of an inhibited ternary complex of 17ß-HSD1 with NADP ${ }^{+}$and $3-$ hydroxyestra-1,3,5,7-tetraen-17-one (equilin) is shown in Figure 1.6. Equilin is one of the major components of estrogens used in estrogen replacement therapy, along with estrone and $17 \alpha$-dihydroequilin. It was observed that the $17 \beta$-HSD1-equilin complex crystallised in space group $P 2_{1} 2_{1} 2_{1}$ with a dimer in the asymmetric unit. A homo-dimer is known to be the functional unit of the enzyme (Lin et al, 1992), and it is this holo-form that represents a true ternary complex of the wild-type enzyme, with the cofactor and a steroidal ligand.

With regards to the ligand-binding interactions, both equilin and NADP ${ }^{+}$have well-defined electron density in the $A$ subunit of the dimeric enzyme. The structure of the active-site of the $17 \beta$-HSD1-equilin complex for the A subunit is shown below in Figure 1.6.

The equilin molecule forms four hydrogen bond contacts with protein atoms, and the 17-keto oxygen accepts protons from catalytic residues Tyr-155 and Ser-142 (2.7 and 2.8Â, respectively) at the catalytic end of the steroid-binding cleft. The 3-hydroxy group of the ligand forms a bifurcated hydrogen bond to His-221 and Glu-282 (2.9 and 2.9 $\AA$, respectively) at the recognition end of the cleft. Therefore with the exception of these two hydrophilic ends, the rest of the steroid-binding cleft is almost exclusively hydrophobic.

The residues Val-143, Met-147, Leu-149, Pro-150, Asn-152, and Tyr-218 compose the protein surface in the vicinity of the $\beta$-Face of the nearly coplanar A-B rings of the ligand (Figure 1.7).

Figure 1.6: Active-site view within the A subunit, NADP $^{+}$and equilin, with side chains of amino acid residues Ser-142, Tyr-155, and Lys-159 at the catalytic end and His-221 and Glu-282 at the recognition end of the active-site cleft. Equilin is not included above, and blue ribbon represents the backbone of the A subunit, and the magenta ribbon represents the B subunit (Sawacki et al, 1999).

The residues Val-225 and Pro-187 are within Van der Waals contact distances to the equilin $\alpha$ face, whereas residues Leu-262, Leu-263 and Met279 are at the floor of the cleft. Figure 1.6 shows the schematic view of the steroid-binding cleft, from a $90^{\circ}$ angle, whereas in Figure 1.7, it is perpendicular to the $\beta$-face of equilin. The amino acid side chains involved in hydrogen bond formation with the ligand (as well as those side chains lining the cleft) are depicted (Sawacki et al, 1999).

Figure 1.7: Diagram of the ligand-binding pocket, viewed roughly perpendicular to the $\beta$-Face of the equilin molecule (Sawacki et al, 1999).

As well as containing the hydrophobic environment of the cleft, Phe-192 and Met-193 from the substrate-entry loop line the entry path, and in the apoenzyme structure, the substrate-entry loop adopts an open conformation providing unrestricted access to the active site cleft (Ghosh et al, 1995). The substrate-entry loop forms a closed conformation instead, in the 17ß-HSD1equilin complex, whereby the polypeptide chain with residues $186-201$ moves towards the catalytic cleft, hence restricting active site access, as shown in Figure 1.7 above. Van der Waals interactions are formed with the ligand molecule, in this closed conformation (Sawacki et al, 1999).

For the mechanism of the hydride transfer, the structure-based hypothesis was proposed, as such that an electrophilic attack on the C17-keto oxygen through strong hydrogen-bonding interactions by the hydroxyl groups from Tyr-155, Ser-142, or both, as well as correct orientation and proximity of C4 $\beta$ hydride of the nicotinamide at the $\alpha$-face of estrone, are required for the transition state initiation of the reaction.

Figure 1.8, shows the open and closed conformations of the substrate-entry loop, where the dimeric $\mathrm{C}^{\alpha}$ backbones of the apoenzyme (Ghosh et al, 1995), the H221L mutant-NAD complex (Mazza et al, 1998), and the 17ß-HSD1equilin complex are superimposed. The overall tertiary structures are nearly identical except for the substrate-entry loop (shown as thicker cross section of the backbone) between the strand $\beta \mathrm{F}$ and the helix $\alpha \mathrm{G}^{\prime \prime}$.

Figure 1.8: Superimposition of the $C^{\alpha}$ backbones of the dimmers of the $17 \beta$ -HSD1-equilin complex (shown in blue), the apo-17ß-HSD1 (shown in magenta) (Ghosh et al, 1995)-E $E_{2}$-complex (shown in yellow) (Breton et al, 1996) illustrating the differences between the substrate-entry loop structures of the $A$ and $B$ subunits. The $A$ subunit loop of $17 \beta$-HSD1-equilin complex is in the closed conformation, whereas the $B$ subunit was modelled after the apo form (Sawicki et al, 1999).

The loop in the A subunit containing well defined electron density except for the Lys-195 side chain and packs against both equilin and NADP ${ }^{+}$via Phe192 and Met-193 is shown in Figure 1.9. Both of these line the substrate-entry
path and are involved in Van der Waals interactions with the D ring of the equilin and the nicotinamide head group of NADP ${ }^{+}$. When the substrate-entry loop is closed, the ligand in the steroid-binding cleft gets trapped and thus occludes the entry path, as shown in Figure 1.7.

Figure 1.9: Substrate-entry loop structure of the A subunit with NADP ${ }^{+}$and equilin. The substrate-entry loops residues are labelled along with the catalytic triad and His-221. The electron density map contoured is shown in orange colour and the densities for all the residues before Ser-142 were removed for clarity (Sawicki et al, 1999).

The location and overall conformation of the cofactor NADP $^{+}$are similar to those in crystal structures of other short-chain dehydrogenases/reductases (Duax et al, 1996). The bound NADP ${ }^{+}$is present in an extended conformation with the adenine ring in an anti conformation and the nicotinamide ring in a syn conformation. This conformation is consistent with the 4-Pro-S hydride transfer from the $B$ face of the nicotinamide ring.

There are 11 different residues that are involved for the specific contacts between the protein and the other cofactor NADP ${ }^{+}$. These are Ser-11, Ser-12, Ile-14, Arg-37, Leu-64, Val-66, Asn-90, Gly-92, Tyr-155, Thr-190 and Phe-192 (Figure 1.10). The adenine nucleoside moiety lies in the cleft surrounded by five segments of the polypeptide, $\beta$ A-to- $\alpha \mathrm{B}$ turn (residues $9-12$ ), $\beta \mathrm{B}$-to- $\alpha \mathrm{C}$ turn (residues 36-38), end of $\beta C$ (residues 64-66), residues $90-93$ from $\beta D$ and val113 from $\alpha \mathrm{E}$. Stabilisation of the nicotinamide nucleoside moiety is achieved through hydrogen-bonding contacts and hydrophobic interactions (Sawicki et al, 1999).

Figure 1.10: Diagram showing NADP $^{+}$interactions with protein and equilin atoms, with the residues and atoms that are involved in direct contacts being labelled appropriately (Sawicki et al, 1999).

## 17ß-HSD inhibitors

The synthesis of inhibitors for $17 \beta$-HSDs in general is difficult as there are many isozymes present for $17 \beta-$ HSD, and so cannot be targeted singly for the inhibitors. Hence the isozymes have been looked at and their inhibitors have
been synthesised for each isozyme. The inhibitors for $17 \beta$-HSD1 and 3 are described in detail below.

### 1.5 173-HSD1 inhibitors

Early work on the inhibitors of $17 \beta$-HSD1 was based on E1 or E2 derivatives which were substituted at $\mathrm{C}-2$ or $\mathrm{C}-4$ (or both), at $\mathrm{C}-3$ or altered in number or location of double bonds (substituted at $\mathrm{C}-1$, disubstituted at $\mathrm{C}-1$, and $\mathrm{C}-2$, disubstituted at $\mathrm{C}-1$ and $\mathrm{C}-4$ ). Also, substitution with an oxygenated B -ring and a substituted C-ring or D-ring was carried out. Jaraback and Sack (1969) investigated other compounds for their inhibitory effect on the reduction of E2 to E1 and most of the compounds which included E2 analogues, C19 and C21 steroid hormones and non-steroidal compounds, were found to inhibit the reduction of E2. From these compounds, 17-desoxy-E2, o,p-DDD and U-11100A (shown in Figure 1.11) were found to be the best inhibitors, having inhibition constants $\left(\mathrm{K}_{\mathrm{i}}\right)$ values of $0.19,0.22$ and $0.61 \mu \mathrm{M}$, respectively. For equilin, an inhibitor concentration ( $\mathrm{IC}_{50}$ ) of $1.9 \mu \mathrm{M}$ was observed, which was similar to the $\mathrm{IC}_{50}$ value of $\mathrm{U}-11-100 \mathrm{~A}(1.5 \mu \mathrm{M})$ (Poirier, 2003).

Figure 1.12 shows some inhibitors which include16-difluoro-E1, m,p-DDD, diethylstilbestrol, and $E 1$ and these inhibited the enzyme with $K_{i}$ values of 2.5, $2.8,3.3$ and $3.7 \mu \mathrm{M}$ respectively (Poirier, 2003).

The inhibition of $17 \beta$-HSD1 from 3-methyl-O-E2 oxidation to 3-methyl-O-E1 (with the $\mathrm{K}_{\mathrm{m}}$ value being $2.2 \mu \mathrm{M}$ ), by C 18 and C 19 steroids and by non steroidal alcohols was discovered by Blomquist et al, (1978). The nonsteroidal alcohols, which were the simple forms of alcohols, were found to be poor inhibitors, with the exception of phenol, which was a non-competitive inhibitor with a $K_{i}$ value of 0.7 mM . The other alcohols were competitive inhibitors with $\mathrm{K}_{\mathrm{i}}$ values of $2,9,10$ and 37 mM , respectively for 1,9 -decanediol, cyclohexanol, benzyl alcohol and cyclopentanol (Poirier, 2003).

Figure 1.11: Some of the early inhibitors synthesised (Poirier, 2003).

The C19 steroids $3 \beta$-hydroxy-5,16-androstadiene, 5 -androsten- $3 \beta$-ol, 5 -androstene-3 $3,16 \beta$-diol and $3 \beta$-hydroxy- 5 -androsten-16-one were tested competitively and these inhibited the enzyme moderately with $K_{i}$ values of 1.8 , $6.0,25.5$ and $36.8 \mu \mathrm{M}$ respectively. They showed weak inhibition for the typical steroids T and DHEA with the $\mathrm{K}_{1}$ values being greater than $225 \mu \mathrm{M}$. The C18 steroids [1,3,5(10)-estratrien-3-ol, 1,3,5(10), 16-estratetraen-3-ol, E1, 1,3,5(10)-estratrien-3-16 -diol, 1,3,5(10)-estratrien-3,16 ,17 -triol, 1,3,5(10)-estratrien- $3,17 \alpha$-diol] were found to be the best competitive inhibitors with $K_{1}$ values of $0.04,0.17,0.4,0.8,1.1,2.2 \mu \mathrm{M}$ respectively (Figure 1.13). Diethylstilbestrol was found to be a good inhibitor of type 1 with a $\mathrm{K}_{\mathrm{i}}$ value of $0.8 \mu \mathrm{M}$ (Poirier, 2003).

### 1.5.1 Affinity labelling agents

Some of the compounds were used to determine information regarding the active site of $17 \beta$-HSD1, and these included E1 analogues as well as steroid analogues, as shown in Figures 1.14a and 1.14b. These compounds bear reactive groups which enable them to react with certain amino acid residues of the enzyme, via irreversible covalent bonding. In addition to these steroid analogues (1-14), which were known to target the substrate binding domain, analogues of the cofactor or of its adenosine moiety (compounds 15 and 16) were synthesised to target the cofactor binding domain (Poirier, 2003).

As seen in Figures 1.14a and 1.14b, various reactive groups were used at various positions on the steroidal skeleton, for example, bromo-acetoxy on compounds 6-8 and on compounds 11-14, as well as iodo (on compound 1), bromomethyl (on compounds 2 and 3), bromoacetamido (on compounds 4 and 5), arylazido- $\beta$-alanine (on compounds 9 and 10), chloroacetyl (on compound 15), and 5 'p-fluorosulfonylbenzoyl (on compound 16).

On the whole, the affinity labelling compounds had a drawback in that they had a low selectivity, however, and this was not seen as a major drawback in terms of the enzyme active site study. Their use in more complex biological systems were prevented however as many of these compounds had shown estrogenic activity. An example was the compound 16 -bromoacetoxy-E1, which was hydrolysed to the weak estrogen, E3. Hence these compounds, in general would not have contributed to being good inhibitors for 173-HSD due to their low selectivity and their estrogenic properties (Poirier, 2003).

### 1.5.2 Suicide inhibitors

In this case, the compounds were known to have acquired alkylating activity after being transformed by the enzyme, hence gaining a higher potential selectivity. Covey et al (1990) developed inhibitors by introducing a $\alpha, \beta$ unsaturated alcohol in position C20, C17 or pseudo C17 of a steroid nucleus, and produced the inhibitors 17, 19 and 21 shown below in Figure 1.15. Compounds 18, 20 and 22 were synthesised following the enzymatic oxidation of the allylic alcohols (17, 19 and 21) into $\alpha, \beta$-unsaturated ketones (Michael acceptors), and these form a covalent bond, inactivating the enzyme via a nucleophilic 1,4-addition of an amino acid residue (Poirier, 2003). Due to oxidation rate problems, modifications such as an introduction of an electrondonating or electron-withdrawing group were carried out, but this did not yield valuable results. Thereafter, introducing a trifluoromethyl group, which is a strong withdrawing group at the end of the triple bond, as in compound 23, provided a species reactive enough to inactivate the enzyme without the oxidation step leading to compound 24.

### 1.5.3 Diketones

Compound 25, (shown in Figure 1.16), was used by Inano et al, (1983) to examine the functional role of some amino acid residues of $17 \beta$-HSD 1. By photooxidising the enzyme with 25, methionyl and tyrosyl residues were completely destroyed and histidyl, arginyl, threonyl and leucyl residues were partially modified. As well as $\mathbf{2 5}$, compounds $\mathbf{2 6}, \mathbf{2 7}, \mathbf{2 8}, 29,30$ and 31 were found to inactivate the enzyme and the $t_{1 / 2}$ for compounds $25-31$ were 2.0 , $0.02,0.19,0.33,4.4,29$ and 5.3 h respectively, at a concentration of 40 mM and a pH of 8.5 .

Furthermore, the presence of an arginine in the steroid binding region was suggested due to the addition of a diketone group to a C18-steroid skeleton, as shown for compound 32, and this inactivated the enzyme in a timedependent fashion by a modification of arginyl residues (Poirier, 2003). The
concentration at which it was tested was 4 mM , and the $\mathrm{t}_{1 / 2}$ for 32 was 0.80 h and this compares more advantageously to compound $\mathbf{2 6}$, which inactivated the enzyme at $\mathrm{t}_{1 / 2}=0.24 \mathrm{~h}$, even though it is smaller in size and also a more reactive compound. The steroid inhibitor was further tested and found to inhibit the enzyme competitively, from human placenta against E2 (noncompetitively against NAD), in a phosphate buffer of pH 7.2 , and this suggested the reversible binding of the compound to the substrate-binding site. Conversely, compound $\mathbf{3 2}$ showed an irreversible inactivation at $\mathrm{t}_{1 / 2}=0.8$ 1.0 h at a concentration of 4 mM , and pH 8.5 , in a time-dependent manner (Poirier, 2003).

Hence, as with affinity labels, the diketone inhibitors were used to understand the enzyme in more detail rather than using them as therapeutic agents.

(31)

(32)

Figure 1.16: Diketones as inhibitors (Poirier, 2003).

### 1.5.4 Fatty acids

The effect of fatty acid activity on soluble $17 \beta$-HSD1 from human placenta was examined by Blomquist et al $\left(1985^{\mathrm{a}}\right)$ and a few fatty acids namely oleic, arachidonic, linoleic and linolenic acids were tested. These were seen to decrease the enzymatic transformation of E2 into E1 from $100 \%$ to $0,0,42$ and $66 \%$ respectively. The fatty acids are shown in Figure 1.17 below.

Oleic acid

Arachidonic acid

Linoleic aicd

Linolenic acid

Figure 1.17: Fatty acids used against 17 $\beta$-HSD1 activity (Poirier, 2003).

The compounds that showed no inhibitory effects were the methyl and ethyl esters of oleic acid, the saturated fatty acid stearic acid, prostaglandin E2 and prostaglandin $\mathrm{F}_{2 \alpha}$. The cofactors NAD, NADH, NADP and NADPH are known to protect against fatty acid inhibition, whereas steroid substrates do not. Finally, the critical micelle concentration of $50 \mu \mathrm{M}$ is required for the inhibition of the enzyme by oleic acid, and the mechanism of inhibition appears to involve the binding of fatty acid micelles at or near sites capable of binding pyridine nucleotides (Blomquist et al, 1985).

### 1.5.5 Pyrazoles and isoxazoles

(33) $\mathrm{R}=\mathrm{H}$
(34) $\mathrm{R}=\mathrm{CH}_{3}$

(35) $\mathrm{R}=\mathrm{H}$
(36) $\mathrm{R}=\mathrm{CH}_{3}$

Figure 1.18: Figure showing pyrazoles and isoxazoles as inhibitors (Poirier, 2003).

The compounds 33-36 (Figure 1.18) were shown to inhibit the enzyme competitively for the reaction of E2 to E1 from human placenta. These were E1 derivatives that have isoxazole ( 35 and 36 ) fused to the 16,17 position on the D-ring (Sweet et al, 1991). The pyrazole based derivative 33 was observed as a better inhibitor than the isoxazole based compound 35, with compound 33 having an $\mathrm{IC}_{50}$ of $4.1 \mu \mathrm{M}$ and compound 35 having a $\mathrm{K}_{\mathrm{i}}$ of $69.4 \mu \mathrm{M}$, and for compounds 34 and 36 the $\mathrm{K}_{\mathrm{i}}$ values were 12.8 and $424.5 \mu \mathrm{M}$ respectively and a free $\mathrm{CH}_{3}-\mathrm{O}$ group is an important requirement for inhibitory activity. It was concluded overall that compound 33 is a better inhibitor than the natural substrate E 1 which had the Ki value of $9.5 \mu \mathrm{M}$ as an inhibitor. The good enzyme affinity can be explained by the fact that there are specific intramolecular hydrogen bonds present between the pyrazole and the phenol groups of the hydroxysteroid and the three specific histidyl residues of the enzyme, hence stabilising the inhibitor-enzyme complex (Poirier, 2003).

### 1.5.6 E1 and E2 C-16 derivatives

Inhibitor 37, shown in Figure 1.19, was developed using classical structureactivity relationship (SAR) studies (Tremblay and Poirier, 1998). Also, cofactor hybrid inhibitors that contained two components, E2 and adenosine, which interacted with two different enzyme-binding sites were looked at (Qiu et al, 2002), one of them being compound 38 shown below in Figure 1.19.

The structures of the three series of compounds (shown in Figure 1.20) were tested against the reductive $17 \beta$-HSD1 activity. Table 1d shows the $\mathrm{IC}_{50}$ values of the different compounds for each of the series.

(37) $\mathrm{R}=\mathrm{H}$ or $\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CONBuMe}$

(38) EM-1745

Figure 1.19: Previously designed inhibitors that interacted with different enzyme-binding sites (Poirier et al, 2003).
$\mathrm{IC}_{50}$ values for the reference inhibitors EM-1745, E1 and E2 were observed as $0.05,0.56-0.58$ and $7.3 \mu \mathrm{M}$, respectively (Poirier, 2003). For compound 39 , the R group was seen to decrease the ability of the enone system to inactivate the enzyme. Hence, compounds 39a-i showed low inhibitory activity compared to the lead compound $\mathbf{3 9 j}$. However, in the case of compound $\mathbf{4 0}$, R increases the inhibitory activity if compared with compounds 40a-i (Thomas et al, 1983).

(39)

| j) H | $0.26-0.33$ | $14-32$ | $0.72-1.3$ |

Table 1d: $\mathrm{IC}_{50}$ values in $\mu \mathrm{M}$ of the series of inhibitors (Poirier et al, 2003).

Series 41 proved even better inhibitors, especially for the phenylmethyl derivative 41 a , which has an $\mathrm{IC}_{50}$ of $0.79-1.0 \mu \mathrm{M}$. For the aryl derivatives, the potency was observed to have increased in the order of series $39<40<41$. This could be explained by the presence of a more flexible $16 \beta$-methylene group, and this allows a better positioning of the aryl moiety and in doing so, there are fewer steric interactions with enzyme amino acid residues (Poirier et al, 2003). Inhibitor 41a was observed to be a more potent inhibitor than EM251 ( $\mathrm{R}=\mathrm{H}$, in Figure 14), but weaker than the hybrid inhibitor EM-1745.

### 1.5.7 Antiestrogens

The compounds 42-52 (shown in Figure 1.21) had potent inhibitory effects on $17 \beta$-HSD activities as well as antiestrogenic activity (Labrie et al, 1992). These are derivatives of E2 and they contain a $7 \alpha$-alkylamide side chain and a D-ring modification, such as a halogen atom or a double bond. All compounds except 43 showed potency as competitive inhibitors for all the enzyme activities such as in the case of the reaction of E1 to E2, E2 to E1, $\Delta^{4}$ dione to $T$ and $T$ to $\Delta^{4}$-dione in uterine tissue.

Tamoxifen (53), which is nonsteroidal, was compared to EM-139 (49), which is steroidal. Compound 53 showed no inhibitory effect if compared to compound 49, which showed inhibition of E1 to E2 activity by 40 and $70 \%$ respectively (Poirier, 2003). However in another model, 53 showed slight inhibition of E1 to E2, as did its metabolites 54 and 55 and the pure steroidal antiestrogen 52, with $\mathrm{IC}_{50}$ values of $>1000,2150,>1000$ and $890 \mu \mathrm{M}$, respectively (Santner and Santen, 1993). These compounds have been shown to have a dual inhibitory action, as such, they block both the estrogen receptor, providing the antiestrogen effect, and estrogen formation providing the inhibitory effect on the enzyme. Hence in this case, dual inhibitors have excellent properties suitable for their use in estrogen-sensitive disease treatment, but their selectivity and their inhibitory potency needs to be improved for 173-HSD1 (Poirier, 2003).

### 1.5.8 Progestins

Progestins were investigated for their activity of inhibition on 17ß-HSD1 by Chetrite et al (1996, 1997, 1999 and 2001). The compounds that were tested for type 1 activity (Figure 1.22) were tested on hormone-dependent MCF-7 and T-47D human breast cancer cell lines. They were the well-known progestins nomegestrol acetate and medrogestone as well as tibolone (56) and its metabolites (57-59).

Figure 1.21: Antiestrogens as inhibitors for $17 \beta$-HSD (Poirier, 2003),

The $I C_{50}$ values of these compounds varied for the MCF-7 cells ( 0.79 to $22.84 \mu \mathrm{M})$ and for the T-47D cells $(0.45$ to $35.25 \mu \mathrm{M})$, and these antiestrogens have also been observed to inhibit the hydrolysis of sulfates and hence stimulate the formation of sulfates (Poirier et al, 2003). These compounds showed weak inhibitions but can offer a treatment method for estrogendependent diseases.

### 1.5.9 Phytoestrogens

These belong to a family of natural products with a variety of biological properties. Phytoestrogens examples include coumarin, coumestrol, flavone,
flavanone, isoflavone and chalcone and these were tested by Makela et al (1995) and they inhibited 17 $\beta$-HSD1 measuring the conversion of E1 to E2 in MCF-7 and T-47D breast cancer cells using purified human placental cytosolic $17 \beta$-HSD. Figure 1.23 shows examples of the phytoestrogens and Table 1 e and 1 f below shows examples of phytoestrogens and their inhibitory values.

Table 1f: Examples of phytoestrogens and their inhibition values (Poirier, 2003).

Coumestrol was the most potent inhibitor, whereas 4,4'-dihydroxybiphenyl, genistein, $\beta$-sitosterol and $\beta$-sitostanol were weak inhibitors. The remaining compounds were inactive at the concentration they were tested $(1.2 \mu \mathrm{M})$. At
0.12 and $1.2 \mu \mathrm{M}$ respectively, coumestrol and genistein inhibited the reduction of E1 to E2 in T-47D breast cancer cells. Also compared to many flavanoids and isoflavanoids that were tested and which showed some inhibition against $17 \beta$-HSD1, coumestrol was still the most potent inhibitor.

SAR was carried out for $17 \beta$-HSD1 and 2 inhibitions. By varying the position and the number of hydroxy groups, it was determined which compound inhibited what isozyme. Chalcones showed low potent activity compared to their flavanoid analogues (Poirier, 2003).

### 1.5.10 Hybrid inhibitors

Hybrid inhibitors (Figure 1.24) were investigated by Tremblay et al (2001), using the rationale that the compounds should contain both hydrophilic and hydrophobic components that should interact with both the steroid binding domain and some amino acid residues of the cofactor binding domain of the enzyme. Examples of these inhibitors (60-68) included E2 derivatives containing various polar groups such as some amino acids. Once the enzyme screening was carried out, it was observed that none of the inhibitors showed much reductive activity for type 1 . Hence a method of increasing interactions with the enzyme was looked at by Poirier et al (2002), as well as investigating the hybrid-molecule types.

Compounds 69-71, which were E2-adenosine hybrid compounds, were then synthesised to follow the substrate and cofactor sites' (Lin et al, 1983), structure-activity relationships (Tremblay and Poirier, 1998; Poirier et al, 2000) and molecular modelling studies of the enzyme inhibition (Zhu et al, 1993; Ghosh et al, 1995; Azzi et al, 1996). Hence these compounds were designed so at to interact with the two binding domains of the enzyme, one being the adenosine moiety to interact with the cofactor binding domain and the E2 moiety to interact with the substrate binding domain. An alkyl-chain spacer was placed between the E2 and adenosine moieties (Poirier, 2003).

The adenosine-E2 hybrids (69-71) inhibited the enzyme reduction of E1 to E2 with $\mathrm{IC}_{50}$ values of 93,52 and 140 nM , respectively and the inhibition depended on the spacer length between the two components i.e. where $n=7$, 8 and 9. Molecular modelling had predicted the optimal spacer length to be 8 methylene groups, and following testing, that was confirmed. With these compounds however, more research needs to be carried out in terms of in vivo and in vitro testing, as well as to optimise their biological activity (Poirier, 2003).

### 1.6 17 $\beta$-HSD 3 inhibitors

### 1.6.1 Early work and Atamestane

Pittaway (1983) discovered that for the inhibition of $17 \beta$-HSD3, a steroid scaffold with a carbonyl at position 17 and a non aromatic A-ring were important factors. From twenty steroids tested, only two compounds namely, 4 -estrene-3,17-dione and 5 -androstene-3,17-dione (Figure 1.25) showed significant competitive inhibition, for the reduction of $\Delta^{4}$-dione using NADPH, with $\mathrm{K}_{\mathrm{i}}$ values of 2.4 and $6.8 \mu \mathrm{M}$, respectively. It was further discovered by Lombardo et al (1993) that an inhibitor called Atamestane, which is a known irreversible aromatase inhibitor, was a potent competitive inhibitor of the reduction process, whereby $\Delta^{4}$-dione is converted to $T$, in human testes. The $K_{i}$ value was not reported but the $K_{m}$ value was found to be $1 \mu \mathrm{M}$, which was measured for the atamestane reduction to its $17 \beta-\mathrm{OH}$ analogue (Poirier, 2003).

4-estrene-3,17-dione

5-androstene-3,17-dione

Atamestane

Figure 1.25: Examples of early inhibitors (Poirier, 2003).

### 1.6.2 Licorice components

The in vivo hydrolysis of the active component of licorice glycyrrhizic acid produces glycyrrhetinic acid (Figure 1.26), which was found to have blocked the formation of $T$ from $\Delta^{4}$-dione, with an $\mathrm{IC}_{50}$ value of $4 \mu \mathrm{M}$. This was not found to be a selective inhibitor for $17 \beta$-HSD3, as it was shown to also inhibit 17,20-lyase activity (converting 17-hydroxyprogesterone into $\Delta^{4}$-dione) (Armanini et al, 1999).

### 1.6.3 Pyrazoles and isoxazoles

Figure 1.26 shows compounds 72 and 73 , which are 2,3 -pyrazoles and compounds 74-77, which are 3,4-steroidal fused pyrazoles, and which were found to inhibit $17 \beta$-HSD3 from the bacterial system, Pseudomonas testosterone (Ferrari and Arnold, 1963). Compounds 74-76 were found to be more potent inhibitors for the oxidation of $T$ to $\Delta^{4}$-dione, with $\mathrm{K}_{\mathrm{i}}$ values of 6,7 and 100 nM respectively, than compounds 72 and 73 , which have $K_{i}$ values of 20 and 15 nM respectively.

77 is the isoxazole analogue of 75 , which was found to be a less active inhibitor with a $K_{i}$ value of 190 nM . The pyrazoles are examples of steroidal inhibitors which were found to inhibit the enzyme in a competitive reversible manner, however, the $17 \beta$-HSD3 from the bacterial system was found to not be a good model for the inhibitors, therefore, these fused pyrazoles should be tested in another enzyme system (Poirier, 2003).

### 1.6.4 Commercially available drugs

Some commercially available drugs for example, gentamicin and the sesquiterpene S-petasin, were looked at and tested on the enzyme 17 $\beta$-HSD3 (Figure 1.27). Gentamicin is an aminoglycoside which is used for the treatment of Gram negative bacterial infections and was tested on rat testicular steroidogenesis (Ghosh and Dasgupta, 1999). For type 3 activity, the percentage inhibitions at doses of 80 and $100 \mathrm{mg} / \mathrm{kg}$ were 34 and $37 \%$ with the compound being a reversible inhibitor. S-petasin, is an antiinflammatory and analgesic, which was tested in vivo and in vitro, In vivo, Spetasin was injected ( $1 \mu \mathrm{~g} / \mathrm{kg}$ ), and the level of basal plasma T concentration was found to decrease by $38 \%$ in adult male rats after 30 min . In vitro, S-
petasin $(0-43 \mu \mathrm{M})$ was incubated with rat testicular interstitial cells in the presence of $\Delta^{4}$-dione $(1 \mathrm{nM})$ and the production of $T$ decreased significantly at S-petasin concentrations of 4.3 and $43 \mu \mathrm{M}$ (Poirier, 2003).

S-petasin

Figure 1.27: Examples of commercially available drugs gentamicin and Spetasin as potential 17 $\beta$-HSD3 inhibitors (Poirier, 2003).

### 1.6.5 Arochlor-1248

Arochlor-1248 consists of a commercial mixture of poly-(tri-, tetra-, and penta) chlorinated biphenyls, and the effect of inhibition on rat testicular androgenesis was carried out by Andric et al (2000). The effect of Arochlor1248 was as such, that in vivo, a decrease in levels of serum T and DHT was observed (29-33\%). In in vitro tests, Arochlor-1248 had an effect on inhibition but only at a micro molar concentration of $10 \mu \mathrm{M}$ and a major effect on inhibition as such, the conversion of progesterone ( P ) into T and DHT was
inhibited, hence making Arochlor-1248 specific towards the enzyme $17 \alpha$ hydroxylase/lyase (Poirier, 2003).

### 1.6.6 Metal salts

Environmental compounds such as metal salts (cationic form), cadmium chloride, and also the presence of excess of NADP during the conversion of T into $\Delta^{4}$-dione inhibited the activity of $17 \beta$-HSD3 (Poirier, 2003).

### 1.6.7 Phytoestrogens and other nonsteroidal compounds

Nonsteroidal compounds (Figure 1.28) under this category were screened for the conversion of $\Delta^{4}$-dione in the presence of NADPH using human testicular microsomes as a source of $17 \beta$-HSD3, and these included $p$-benzoquinones, flavones, isoflavones and triphenylethene derivatives (Le Lain et al, 2001). The substrate ( $\Delta^{4}$-dione) concentration was $2 \mu \mathrm{M}$ and the $\mathrm{IC}_{50}$ values of the compounds ranged from 2.7 to $100.5 \mu \mathrm{M}$ and the most potent compounds were found to be 79 ( 2,5 -diphenyl-p-benzoquinone at $2.7 \mu \mathrm{M}$ ), 78 (phenyl-pbenzoquinone at $5.7 \mu \mathrm{M}$ ), 80 ( 7 -hydroxyflavone at $9.0 \mu \mathrm{M}$ ), 82 (triphenylethene derivative at $9.1 \mu \mathrm{M}$ ), 81 (baicalein at $9.3 \mu \mathrm{M}$ ) and 95 (biochanin A at $10.8 \mu \mathrm{M}$ ). Comparing these compounds to the $K_{m}$ values, their potency remained low, and after their SAR studies were carried out, the hydroxyl groups of the flavones were regarded as a factor that might be involved in inhibition. However the phytoestrogens, flavone and isoflavones showed estrogenic activity and/or inhibitory activities for other steroidogenic enzymes.

These compounds were then tested on rat testicular microsomes, where the hormone inhibitory activity was found to be at $0.77 \mu \mathrm{M}$, however, this enzyme preparation was found to be much less sensitive to enzyme inhibition, hence preventing its use as a more readily available source of the enzyme (Le Lain et al, 2001). Thereafter, six coumarin and eleven triphenylethene derivatives were tested, and 2,5 -diphenyl-p-benzoquinone (79) was found to be a better inhibitor than the triphenylethene derivatives, and two coumarins namely
umbelliferone (83) and 4-methylumbelliferone (84) showed better inhibition with $\mathrm{IC}_{50}$ values of 1.4 and $0.9 \mu \mathrm{M}$, respectively (Poirier, 2003).

Compounds 85-92 which are a series of tetralins were patented and tested by Smith et el (2001) and the structure of these tetralins is similar to 95 (biochanin). Compounds 85-87, upon being tested in human testicular microsomes, at pH 7.5 for the reduction of $\Delta^{4}$-dione at $2 \mu \mathrm{M}$ to T , gave $\mathrm{IC}_{50}$ values of $1.8,8.3$ and $7.0 \mu \mathrm{M}$ respectively. Compounds $85-92$ were further tested on rat testes for the reduction of $\Delta^{4}$-dione at $0.5 \mu \mathrm{M}$, and the percentages of inhibition at $100 \mu \mathrm{M}$ were from $58 \%$ to $\mathbf{7 9 \%}$. Compounds 85 and 87 were found to be less potent on the rat enzyme than on the human enzyme and the dichloro derivative 88 was found to be the most potent inhibitor with an $\mathrm{IC}_{50}$ of $32.7 \mu \mathrm{M}$. Compounds such as 93 that consist of the general structure of novel tetralone or benzopyrane derivatives, are similar to and related to compounds such as $\mathbf{8 5 - 9 0}$, and these compounds were used as preventative and/ or curative drugs for various diseases sensitive to male and female hormones. Compound 94 is also an example of a benzofuran derivative that was used as treatment for hormone-sensitive diseases, which inhibited $17 \beta$-HSD activity (Nakakoshi et al, patent).

### 1.6.8 Androsterone derivatives

Poirier et al (1995) investigated the C-19-steroid androsterone (ADT, 96) as a potential starting nucleus to develop 173-HSD3 inhibitors. Based on the results that were obtained during the development of $17 \beta$-HSD1 inhibitors, derivatives of ADT were synthesised, which were substituted at position 16 with a bromopropyl side chain (Tremblay and Poirier, 1998). These inhibitors however turned out to be weak inhibitors for 17ß-HSD3 (Ngatcha et al, 2002). The compounds 97-107 which are shown in Figure 1.29, bear different $3 \beta$ substituents, and their $\mathrm{IC}_{50}$ values obtained were in the range of $57-200 \mathrm{nM}$ which was better than ADT (300nM).

(94)

(95) Biochanin

Figure 1.28: Examples of phytoestrogens and other nonsteroidal compounds as inhibitors (Poirier, 2003).

The compounds that were found to be potent in this group were $106(3 \beta-$ phenylmethyl-ADT), 104 ( $3 \beta$-cyclohexyethyl-ADT), 98 ( $3 \beta$-propyl-ADT), 99 ( $3 \beta$-sec-butyl-ADT), with $I C_{50}$ values of $57,60,67$ and 73 nM respectively (Ngatcha et al, 2000). Furthermore, these compounds showed specific inhibition as such, they did not inhibit any other reductive $17 \beta$-HSD types. The disadvantage with using these compounds was that they induced proliferation
of androgen sensitive (AR ${ }^{+}$) Shionogi cells, thereby indicating androgenic activity.

Following this, compounds were synthesised using solid-phase parallel synthesis by Maltais et al (2001), to avoid the problem of androgenic activity as well as to optimise a new class of inhibitors. These compounds consisted of model libraries of $3 \beta$-peptido- $3 \alpha$-hydroxy- $5 \alpha$-androstan-17-ones with 1, 2 or 3 molecular diversity levels. The compounds from the libraries that were found to be potent inhibitors were six members of the level 3 library, which bear at least one phenyl group. Compound 108 was found to inhibit the enzyme, with an $\mathrm{IC}_{50}$ value of 227 nM , and this was twice as potent as the natural substrate $\Delta^{4}$-dione which was used as an inhibitor itself. To test out its androgenic activity, compound 108 was tested on $\mathrm{AR}^{+}$cells and it was found to induce proliferation slightly at $1 \mu \mathrm{M}$ and no proliferative activity at $0.1 \mu \mathrm{M}$ (Poirier, 2003).

A parallel liquid-phase approach was developed whereby the inhibitory activity of the $3 \beta$-substituted ADT derivatives was optimised (Maltais and Poirier, 1998; Maltais et al, 2002). Following this, three libraries of $3 \beta$-amidomethylADT derivatives (168, 56 and 49 members), as well as two molecular diversity levels on the amide ( $\mathrm{R}^{1}$ and $\mathrm{R}^{2}$ ) were synthesised. These compounds were screened and the most potent inhibitors were found to be compounds 109112 with $\mathrm{IC}_{50}$ values of $35-85 \mathrm{nM}$.

Also a 25 -membered library, which consisted of 3 -carbamate-N-substituted$5 \alpha$-androstan-17-one was synthesised, which allowed more rigid molecules to be prepared, and which had two levels of molecular diversity within the local area that was occupied by the adamantane group. One of the most potent inhibitors from this particular library was compound 113, which showed similar potency to compound 111 and showed no androgenic activity. Compounds 96-113 are shown in Figure 1.29 below, and Table 1 g shows the $\mathrm{I}_{50}$ values and their androgenic activity values for compounds 109-113, which were compared to compounds 106 and 96 (Poirier, 2003).

Figure 1.29: Androsterone derivatives as inhibitors for $17 \beta$-HSD3 (Poirier, 2003).

### 1.6.9 Novel series of tetrahydrodibenzazocines

These inhibitors were based on a dibenzazocine core, and they inhibited the enzyme at picomolar to low nanomolar concentrations, in cell-free enzymatic as well as in cell-based transcriptional reporter assays (Fink et al, 2006). The initial focus was based on structures shown below (Figure 1.30) which consisted of a dibenzothiazocine (DBT) and tetrahydrodibenzazocine (THB) series.

| Compound | X | R1 | R2 | $\begin{aligned} & \hline \mathrm{IC}_{50} \\ & (\mathrm{nM}) \end{aligned}$ | Androgenic activity (\%) @ $0.1 \mu \mathrm{M}$ | Androgenic activity (\%) @ $1 \mu \mathrm{M}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 109 | 0 | Octyl | Cyclopropyl | 57 | 0 | 0 |
| 110 | 0 | Cyclohexylmethyl | Cyclopropyl | 85 | 1 | 0 |
| 111 | 0 | Adamantylmethyl | Propyl | $\begin{aligned} & 35- \\ & 57 \end{aligned}$ | 7 | 96 |
| 112 | $\mathrm{H}_{2}$ | Adamantylmethyl | Propyl | 80 | 3 | 7 |
| 113 | 0 | Morpholino | Cyclopentylethyl | 74 | 4 | 6 |
| 106 | - | - | - | $\begin{aligned} & 57- \\ & 98 \end{aligned}$ | 27 | 100 |
| 96 (ADT) | - | - | - | $\begin{aligned} & 182- \\ & 330 \end{aligned}$ | 14 | 2 |
| $\Delta^{4}$-dione | - | - | - | $\begin{gathered} 489- \\ 758 \end{gathered}$ | Not determined | Not determined |

Table 1g: $\mathrm{IC}_{50}$ values for inhibitors of $17 \beta$-HSD3 and their androgenic activity on Shionogi ( $\mathrm{AR}^{+}$) cells (Poirier, 2003).

Dibenzothiazocine (DBT)
$\mathrm{IC}_{50}(\mu \mathrm{M})$ for enzyme $=0.40$ and for cellular $=0.32$

Tetrahydrodibenzazocine (THE
$\mathrm{IC}_{50}(\mu \mathrm{M})$ for enzyme $=0.09$ and for cellular $=0.22$

Figure 1.30: Inhibitors based on tetrahydrodibenzazocines (Fink et al 2006).

After the SARs in the DBT and THB series were carried out, it was found that within the DBT series, the derivatives with the addition of a halogen at the 2-
or 3- position yielded in a 4 - to 10- fold improvement in potency in the biochemical as well as cell-based assays. The results are shown in Table 1h below.

| Substitution group | $\mathrm{IC}_{50}(\mu \mathrm{M})$ for enzyme <br> assay | $\mathrm{IC}_{50}(\boldsymbol{\mu M})$ for cellular <br> assay |
| :---: | :---: | :---: |
| $2-\mathrm{Cl}$ | 0.10 | 0.16 |
| $3-\mathrm{Cl}$ | 0.03 | 0.17 |
| $2-\mathrm{F}$ | 0.09 | 0.29 |
| $2-\mathrm{Br}$ | 0.25 | 0.12 |

Table 1h: Table showing inhibition values for the halogenated 2- and 3substitutions (Fink et al, 2006).

The optimum substitution was chlorine, as the activity was found to decrease with both Fluorine and bromine. Alongside these values, the 2,3-dichloro derivative was found to be the most potent but only in the enzymatic assay ( $\mathrm{IC}_{50}=0.01 \mu \mathrm{M}$ ) and not in the cell-based assay ( $\mathrm{IC}_{50}=0.13 \mu \mathrm{M}$ ). It was also found that by substituting at positions 1- or 4-did not yield in inhibition, and this suggested that the enzyme makes close contacts with these regions of the DBT nucleus.

In case of the THB series, halogen substitution of the A-ring did not improve activity, however bromine substitution on the C -ring at either position 8- or 9improved both the biochemical and cellular activity. For the 8 - substitution, $\mathrm{IC}_{50}$ values of the enzymatic and cellular assays were 0.009 and $0.032 \mu \mathrm{M}$, respectively, and for the 9 - substitution being 0.007 and $0.036 \mu \mathrm{M}$ respectively, with an $R$ group on the nitrogen on ring $B$ being a $C(O) M e$ group in both compounds. Furthermore, substitutions at the 8 - and 9 -positions with groups as a primary amine or a primary carboxamide, resulted in low activity. Data suggested this the region of the molecule (8-) extends into a hydrophobic pocket, and the addition of a phenyl group at position 8 - confirmed this
hypothesis, by giving values such as $0.00002 \mu \mathrm{M}$ for the enzyme assay and $0.004 \mu \mathrm{M}$ for the cellular assay (Fink et al, 2006).

Further to the addition of the phenyl group at position 8-, electron-donating groups such as methyl ester groups at the ortho-, meta- and para- positions were added around the aryl ring, and it was observed that the ortho- position was preferred with $\mathrm{IC}_{50}$ values of 0.002 (enzyme assay) and $0.005 \mu \mathrm{M}$ (cellular-based assay). With the use of electron-withdrawing groups such as the CN group on once again the ortho-, meta- and para- positions, reduced activity was observed. The next step was the use of sulphonamides at the ortho- position, which increased the potency by a 100 -fold ( 0.002 and $0.009 \mu \mathrm{M}$ for the enzyme and the cellular-based assay, respectively). A dramatic increase in potency was further observed by the incorporation of a carbonyl group at the ortho- position. The methyl ester showed picomolar activity with $\mathrm{IC}_{50}$ values of 0.00002 (enzyme assay) and $0.0005 \mu \mathrm{M}$ (cell-based assay). The methyl ketone was found to be equipotent with values of 0.00002 (enzyme assay) and $0.0005 \mu \mathrm{M}$ (cell-based assay).

These results and compounds were found to be potent against this enzyme and hence may provide an alternative approach for the disruption of testosterone biosynthesis by examining its role in both endocrine-sensitive and -resistant prostate tumour models (Fink et al, 2006).

## $1.73 \beta$-Hydroxysteroid dehydrogenase $\Delta^{5}-\Delta^{4}$-isomerase ( $3 \beta-H S D$ )

$3 \beta$-HSD is a membrane-bound enzyme that is dependent on NAD ${ }^{+}$, and catalyses also the conversion of pregnenolone (PREG) to $\mathrm{P}, 17 \alpha-$ hydroxypregnenolone ( $17 \alpha \mathrm{OH}$-PREG) to $17 \alpha$-hydroxyprogesterone $(17 \alpha \mathrm{OH}$ P), $\Delta^{5}$-diol to T and DHEA to 4-androstenedione ( $\Delta^{4}$-DIONE). The reaction is shown in Figure 1.31. AD is converted to E2 by placental AR and 173-HSD, which takes part in initiating labour in humans after triggering off a cascade of events (Rainey et al, 2002; Kacsoh, 2000). 3 $\beta$-HSD's deficiency causes a rare
form of congenital adrenal hyperplasia, which is associated with a male pseudohermaphroditism (Durocher et al, 2005).

Two types of $3 \beta$-HSD were isolated from humans (Luu et al, 1989; Rheaume et al, 1991), which share a very high homology ( $93.4 \%$ amino acids identity) and are expressed in a tissue-specific manner (Lachance et al, 1991). Type 1 is expressed in the placenta, skin and mammary glands, whereas type 2 is expressed in the gonads and adrenals (Rheaume et al, 1991). This enzyme is also present in several peripheral tissues such as the liver, adipose tissue, brain, kidney, epididymis, vas deferens, lung, prostate, bone and cardiovascular tissue, where it is involved in the formation of sex steroids (Durocher et al, 2005).

Figure 1.31: $3 \beta$-HSD/isomerase catalysing two reactions on a single enzyme protein (Thomas et al, 2004).

### 1.8 Estrone Sulfatase (ES)

Human ES is a member of a protein family in a group of hydrolytic enzymes, from the human arylsulfatase family, and there are at least six namely $A, B, C$, D, E and F (Pasqualini, 2004).

ES converts the stored (sulfated) form of the estrogens to the active (nonsulfated) form, thereby allowing the stimulation of estrogen-dependent tumours via a non-aromatase (AR) pathway (which is, therefore, not blocked by AR inhibitors) (Ahmed et al, 2002). $\mathrm{E}_{2}$ formation in human breast tumours
was assessed quantitatively, and that indicated that the metabolism of EST via the sulfatase pathway produces 100-500 times more $E_{2}$ than androgen aromatisation. It was also found that the breast tissue possesses the enzyme EST that is involved in the conversion of estrogens to their sulfates which are biologically inactive (Shields-Botella et al, 2005).

ES is a monomer microsomal enzyme, which is membrane-bound to endoplasmic reticulum, and as mentioned, is responsible for the conversion of estrone sulfate to E1 (Figure 1.32), but it also controls DHEA formation from dehydroepiandrosterone sulphate (DHEAS) (Labrie et al, 2003; HernandezGuzman et al, 2001). It is found in the mammary cells, uterine cells (Brinbock, 1990) and in target organs for example, liver, endometrium, ovaries, bone, brain, prostate, white blood cells and adipocytes. It is found predominantly in placenta and in breast cancer tissue (Pasqualini, 2004).

Figure 1.32: Action of the enzyme ES on estrone sulfate (Brinbock, 1990).

Much of the estrone formed from the AR pathway (Figure 1.1) is metabolised to the conjugated sulfate [by EST (Hobkirk et al, 1993)], which can act as a reservoir for the formation of E 1 , by the enzyme ES .

ES exists in a glycosylated form, which has been demonstrated by its ability to bind to concanavalin-A-sepharose (Purohit et al, 1998). The instability of this enzyme outside the microsome has prevented the pure enzyme from being isolated.

The exact mechanism of desulphonation has yet to be fully determined, however, studies are underway to crystallise the steroidal sulfatase enzyme, enabling a full x -ray crystal structure to be determined (Purohit et al, 1998). There is also controversy as to whether ES and another enzyme, dehydroepiandrosterone sulfatase (DHEA-STS) which converts DHEA-S to DHEA, are the same or different enzymes (Reed et al, 1996). Strong evidence has been shown to suggest that they are in fact the same enzyme (Dibbelt et al, 1986). An ES inhibitor was shown to inhibit the hydrolysis of both estrone sulfate and DHEA-S, suggesting that only one enzyme is responsible for both. Transferring a copy of the placental steroid sulfatase gene (cDNA) into COS-1 cells presented further evidence. The steroid sulfatase enzyme was capable of hydrolysing both sulfates (E1 and DHEA), demonstrating that only one enzyme is responsible for the hydrolysis of both alkyl and aryl steroid sulfates (Purohit et al, 1994).

Androstenediol is thought to be as important in the stimulation of breast cancer cells as (E2), with $90 \%$ of androstenediol synthesised in postmenopausal women originating form DHEA-S. This is then converted to DHEA through the action of DHEA-STS, and further metabolised to androstenediol under the action of testicular $17 \beta$ HSD3 (Andersson et al, 1995). Another route may be the hydrolysis of androstenediol sulfate to androstenediol (Figure 1.33). Androstenediol possesses estrogenic properties and can bind to estrogen receptors, stimulating the growth of breast tumours (Adams et al, 1981).

Tumour stimulation without estrogens may explain why AR inhibitors have failed to give the desired response rates in hormone-dependent breast tumours, emphasising the importance of developing a sulfatase inhibitor which would inhibit both estradiol and androstenediol synthesis, thereby reducing the levels of tumour-stimulating hormones.

### 1.9 Mechanism of estrone sulfatase

From previous studies, it was found that potent inhibitors of ES contain an aminosulfonate moiety, which is known to inhibit the enzyme irreversibly, whereas compounds containing different substituents have shown to be weak and reversible inhibitors. Not much information is known about the active site of ES, and so to work out the nature of the pharmacophore as well as to rationalise the irreversible activity of the aminosulfonate based compounds, SAR studies were carried out extensively, which would aid further in understanding the mechanism. It was also established that factors such as $\mathrm{pK}_{\mathrm{a}}$ of the parent phenol is an important factor in the inhibition of the enzyme, whereby the hydrolysis of the S-OR bond was seen as a very important feature in the inhibition process (Ahmed et al, 2002). This is shown in Figure 1.34.

Figure 1.34: Hydrolysis of phenyl aminosulfonate containing compounds (Ahmed et al, 2002).

Hence using synthesised alkyl and phenyl sulfamates, the inhibitory activity was evaluated so as to understand the mechanism in detail. In addition to this, the SAR studies of the phenyl substituted sulfamate based compounds provided a good correlation between $\mathrm{pK}_{\mathrm{a}}$ and inhibitory activity, and also confirmed the moiety used, as such, the use of strong electron withdrawing groups for example, $\mathrm{NO}_{2}$ and CN attached to the phenyl ring resulted in potent inhibitory activity as compared to electron donating groups for example $\mathrm{CH}_{3}$, which resulted in poor inhibitory activity. Therefore, using this rationale of the stabilisation effect of the electron withdrawing group on the phenoxide ion (Ahmed et al, 2000), it was suggested that the inhibitory activity of the phenolic compounds depended on the sulfamate moiety, which undergoes hydrolysis and hence is important in irreversible inhibition.

Hence the first step of the mechanism, which is the crucial step, involves the cleavage of the S-OR bond, which results in the formation of $\mathrm{RO}^{\circ}$ and sulfamic acid. Sulfamic acid was found to be involved in the inhibition of ES rather than the alkyl or phenyl sulfamate. Therefore after taking into consideration the proposed mechanism by Ahmed et al, of the desulphatation of estrone sulphate (shown in Figure 1.35), as well as the SAR data for the sulfamate based compounds, a novel mechanism (shown in Figure 1.36) for the irreversible inhibition of ES was proposed (Ahmed et al, 2002).

Figure 1.35: Desulphatation reaction catalysed by ES (Ahmed et al, 2002).

As mentioned previously, cleavage of the S-OR bond occurs via the attack by the gem-diol moiety on the sulfamate group. The gem-diol moiety is proposed to exist in the active site of the enzyme [(Waldow et al, 1999), as shown in Figure 1.35)]. This attack allows the formation of an aldehydic moiety, the ROion and sulfamic acid, and an important step in the catalytic and inhibition process, is the formation of the $\mathrm{C}=\mathrm{O}$ group [(Waldow et al, 1999; Bond et al, 1997), (as shown in Figure 1.35)]. This confirms the fact that without the formation of the aldehydic group from the gem-diol, it is not possible for irreversible inhibition to take place.

The $\mathrm{NH}_{2}$ group of the sulfamate then attacks the newly formed aldehydic group, which results in the formation of an imine type structure, and that involves the loss of a water molecule, hence resulting in irreversible inhibition of ES (as shown in Figure 1.36). Another fact whereby irreversible inhibition of ES has occurred is due to the formation of the $\mathrm{C}=\mathrm{N}$ bond, which causes the enzyme to not cycle through the catalytic process (Ahmed et al, 2002).

Figure 1.36: Mechanism of irreversible inhibition of ES by sulfamate based compounds and the release of sulfamic acid via the initial cleavage of the SOR bond (Ahmed et al, 2002).

Hydrophobicity was another factor which was still not fully understood and explained as to how its involvement affects the inhibition, especially the log of the partition coefficient. To investigate this, a series of 4 -hydroxycinnamic acid esters were sulfamated and these showed that the hydrophobicity of the carbon backbone of the inhibitors was indeed an important factor in ES inhibition (Ahmed and Patel, 2002). This further led to the proposal that the RO was expelled out of the active site by the $\log P$ of the inhibitors which were involved in destabilising the enzyme-product complex and at the same time, allowing the sulfamic acid to attack the $\mathrm{C}=\mathrm{O}$ group within the active site, and this led to the conclusion that high inhibitory activity of the sulfamated compounds was due to high hydrophobicity (Ahmed et al, 2002).

With highly hydrophobic compounds, the $\mathrm{RO}^{-}$is expelled out of the active site due the group becoming unstable, and due to that, the sulfamic acid attacks the $\mathrm{C}=\mathrm{O}$ group leading to the imine product and hence the irreversible inhibition of ES. This rationale can be used therefore for the desulphatation of estrone sulphate (as shown in Figure 1.35), as such the hydrolysis of estrone
sulphate forms the estrone anion, which in turn causes destabilisation of the enzyme-product complex, and that results in the steroid moiety getting expelled and hence undergoing an irreversible inhibition (Ahmed et al, 2002).

### 1.10 Estrone sulfatase inhibitors

There are no ES inhibitors currently available on the market as yet, but synthesis of a large number of steroidal and non-steroidal compounds has been carried out which have shown potent inhibitory activity against this enzyme.

### 1.10.1 Steroidal inhibitors

Danazol (Figure 1.37) was an inhibitor synthesised that was found to possess inhibitory activity (Carlstrom et al, 1984a), and was also found to be a relatively weak competitive inhibitor in mammary cell lines with $K_{i}$ values of 2.3-8.2 $\mu \mathrm{M}$ (Nguyen et al, 1993) and inhibited placental microsomal ES by $60 \%$ at $10 \mu \mathrm{M}$ inhibitor concentrations (Selcer et al, 1996) .

E1-MTP (Figure 1.37) was the first steroid-based compound, that was a specific ES inhibitor (Cox et al, 1979), and it acted as a steroid sulfate structural mimic when used for the generation of antibodies which recognised estrone sulfate. It was found to be 14 times more potent than danazol, and is a reversible inhibitor acting in a time-independent and competitive manner, i.e. after the inhibitor had been removed from the assay mixture after a given amount of time, ES activity was restored. It possessed a $\mathrm{K}_{\mathrm{i}}$ value of $37.5 \mu \mathrm{M}$ (Duncan et al, 1993) and an $\mathrm{IC}_{50}$ value of 90 nM in intact MCF-7 breast cancer cell lines (Purohit et al, 1995).

EMATE (estrone-3-O-sulfamate) (Figure 1.37) in intact MCF7 breast cancer cells showed $95 \%$ ES inhibition (at 2 nM ), and an $\mathrm{IC}_{50}$ value of 65 pM in MCF-7 cells (Purohit et al, 1995; Howarth et al, 1994) and 4 nM in placental
microsomes. EMATE, compared to E1-MTP, was found to be a potent irreversible inhibitor (Purohit et al, 1995).

Figure 1.37: Figure showing examples of steroidal inhibitors of ES (Ahmed at al 2002).

### 1.10.2 Non-steroidal inhibitors

The steroidal inhibitors were found to be potent inhibitors, however some possessed estrogenic activity, therefore non-steroidal inhibitors were investigated and synthesised.

A large number of non-steroidal inhibitors have been synthesised, and considered as mimics of the steroidal backbone, for example, $A, A B$ and $A D$ ring mimics of the steroid backbone.

4-Methylcoumarin-7-O-sulfamate (COUMATE) (Figure 1.38) has been found to be a non-estrogenic active site directed ES inhibitor (Purohit et al, 1996), and possessed an $\mathrm{IC}_{50}$ value of 380 nM and was found to inhibit ES in a timeand concentration dependent manner (Purohit et al, 1996). A series of tricyclic coumarin sulfamates has also been synthesised, and 667-COUMATE (Figure 1.38) was the most potent inhibitor, and was three times more potent than EMATE and a hundred times more potent than COUMATE in inhibiting ES.

COUMATE

667-COUMATE

Figure 1.38: Non-steroidal inhibitors (Woo et al, 2000).

## Sulfamated esters of 4-hydroxycinnamic acid and 3-(4-hydroxyphenyl) propanoic acid

A series of sulfamated esters of 4-hydroxycinnamic acid and 3-(4hydroxyphenyl) propanoic acid (shown in Figure 1.39) were synthesised by Ahmed et al, and these were tested for their mode of action as well as their physicochemical properties via $\mathrm{pK}_{\mathrm{a}}$ and LogP studies, and also the SAR was determined. These compounds' activity was compared to the standard compounds EMATE, COUMATE and 667-COUMATE (Ahmed et al, 2004). The compounds and their $\mathrm{IC}_{50}$ values are shown below in Table 1 i .

| COUMATE | $13.8 \pm 0.07$ |
| $667-$ COUMATE | $0.21 \pm 0.01$ |

Table 1i: Sulfamated esters of 4-hydroxycinnamic acid and 3-(4hydroxyphenyl) propanoic acid and their $I \mathrm{C}_{50}$ values (Ahmed et al, 2004).

The esters of 4 -sulfamoylated cinnamic acid were found to be weak inhibitors compared to the standard compounds EMATE, COUMATE and 667COUMATE. Compound 117 was found to be the most potent with an $\mathrm{I}_{50}$ value of $63.5+2.1 \mu \mathrm{M}$, but this in comparison to the three standard compounds, was a weak inhibitor. Furthermore, the ester derivatives of 3-(4sulfamoylated phenyl) propanoic acid, which were the reduced forms of compounds 114-122, were synthesised. These compounds were found to be
very weak as inhibitors, compared to the sulfamoylated esters of the 4hydroxycinnamic acid and the three standard compounds. It was proposed that in the case of the sulfamated esters of 4-hydroxycinnamic acid, the reason behind the reduced inhibitory activity was the fact that there was freedom of rotation of the two C-C bonds, which resulted in the overall conjugation to decrease. In doing so, the stabilisation of the phenoxide ion, which was produced via the sulfamate group hydrolysis, had reduced. Another factor also related to the inhibitory activity was the size of the molecule and in this case, it was the chain length, which when increased caused steric interaction with the active site that corresponded to the $\mathrm{C}(17)$ area of the steroid backbone.

## Sulfamates of 4-hydroxyphenyl esters

Following the compounds above which were synthesised by the group, the next series of compounds that were synthesised and their activity was tested, were a series of sulfamates of 4-hydroxybenzoic acid esters (Shown in Figure 1.40). The series consisted of straight-chain and cyclic-alkyl esters and some of these were tested by initial screening with $\mathrm{IC}_{50}$ values also being obtained (Table 1j) (Ahmed et al, 2003).

$132 \mathrm{R}=\mathrm{C}_{5} \mathrm{H}_{11}$
$133 \mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{13}$
$134 \mathrm{R}=\mathrm{C}_{7} \mathrm{H}_{15}$
$135 \mathrm{R}=\mathrm{C}_{8} \mathrm{H}_{17}$
$136 \mathrm{R}=\mathrm{C}_{5} \mathrm{H}_{10}$ (cyclic)
$137 \mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{12}$ (cyclic)
$138 \mathrm{R}=\mathrm{C}_{7} \mathrm{H}_{14}$ (cyclic)
$139 \mathrm{R}=\mathrm{C}_{8} \mathrm{H}_{16}$ (cyclic)

Figure 1.40: Some of the sulfamates of 4-hydroxybenzoic acid esters (Ahmed et al, 2003).

| Compound | $\mathrm{IC}_{50}(\mu \mathrm{M})$ |
| :---: | :---: |
| 132 | $5.9 \pm 0.44$ |
| 133 | $3.8 \pm 0.16$ |
| 134 | $3.4 \pm 0.25$ |
| 135 | $5.0 \pm 0.26$ |
| 136 | $9.3 \pm 0.07$ |
| 137 | $1.7 \pm 0.07$ |
| 138 | $0.5 \pm 0.03$ |
| 139 | $0.2 \pm 0.01$ |

Table 1j: Table showing the sulfamates of 4-hydroxybenzoic acid esters with their $\mathrm{IC}_{50}$ values (Ahmed et al, 2003).

From the synthesis and data obtained, it was found that all compounds above showed good inhibitory activity, and were also more potent than the standard COUMATE (with an $\mathrm{IC}_{50}$ value of $12 \pm 0.3 \mu \mathrm{M}$ ), and the sulfamates of the esters numbered 132-135 were weaker than EMATE (with an $\mathrm{IC}_{50}$ of $0.5 \pm 0.01 \mu \mathrm{M}$ ) and 667-COUMATE (with an $\mathrm{IC}_{50}$ value of $0.25 \pm 0.01 \mu \mathrm{M}$ ). Compounds 136139 on the other hand, which were the sulfamates of the cyclic esters were found to be equipotent to EMATE and 667-COUMATE, with the cyclooctyl derivative (139) being roughly 1.5 times more potent than the latter compound. Finally, these compounds were found to inhibit ES in an irreversible manner and were time-dependent (i.e. could not be dialysed with time) especially compound 139 , which was found to be more potent than 667COUMATE, which has been in Phase I clinical trials (Ahmed et al, 2003).

## AC ring mimics

These compounds were synthesised after the hypothesis that they would inhibit ES by mimicking the steroidal backbone, as such these compounds consisted of sulfamated biphenyls, where the biphenyl moiety would mimic the A and C rings of the steroid backbone and the R group would be involved in hydrogen bonding with any H -bonding group(s) that would be present within
the active site of ES (Ahmed et al, 2002). The structure of the compound is shown in Figure 1.41. The sulfamates that were synthesised were 4-O-sulfamoyl-4-biphenyls and their inhibitory activity and their mode of action was investigated.

Figure 1.41: Biphenyl sulfamates relationship to EMATE (Ahmed et al, 2002).

The compounds were tested using a literature method (Purohit et al, 1998) and the results are shown below in Table 1 k , with the compounds and their corresponding R groups, the compound numbers and their $\mathrm{IC}_{50}$ values.

| Compound (R) | Compound Number | $\mathbf{I C}_{50}(\mu \mathbf{M} /$ tube $)$ |
| :---: | :---: | :---: |
| H | $\mathbf{1 4 0}$ | $76.1 \pm 0.9$ |
| CN | $\mathbf{1 4 1}$ | $6.7 \pm 0.01$ |
| COOMe | $\mathbf{1 4 2}$ | $5.2 \pm 0.07$ |
| COOEt | $\mathbf{1 4 3}$ | $4.2 \pm 0.01$ |
| COOPr | $\mathbf{1 4 4}$ | $3.5 \pm 0.01$ |
| COOBu | $\mathbf{1 4 5}$ | $5.8 \pm 0.02$ |

Table 1 k : Table showing the inhibition data for the synthesised biphenyl sulfamates (Ahmed et al, 2002).

All the compounds were found to be weak inhibitors in comparison to EMATE $(0.5 \pm 0.01 \mu \mathrm{M})$ and $667-\operatorname{COUMATE}(0.2 \pm 0.01 \mu \mathrm{M})$. However comparing the compounds to COUMATE $(10 \pm 0.3 \mu \mathrm{M})$, all the compounds showed good
inhibitory activity except compound 140; compound 144 was found to be approximately three times more potent than COUMATE. These compounds were also found to be irreversible inhibitors of ES and were good inhibitors and hence the biphenyl structure is under further investigation to improve potency (Ahmed et al, 2002).

## Sulfamates of 4-hydroxyphenyl ketones

Following the synthesis of the sulfamates of the esters, the research group investigated the activity of sulfamates of 4-hydroxyphenyl ketones (Figure 1.42). These compounds were also tested for their mode of action and for their biochemical evaluation, and their $\mathrm{IC}_{50}$ values are shown in Table 11.

Figure 1.42: Sulfamates of 4-hydroxyphenyl ketones (Ahmed et al, 2002).

Compounds $\mathbf{1 4 6 - 1 5 7}$ were found to be potent inhibitors, and in comparison to EMATE $(0.5 \pm 0.001 \mu \mathrm{M})$, compound 153 (which was the most potent compound of the group) was about 6.8 times weaker. With regards to COUMATE, most of the compounds were either equipotent or higher in potency than COUMATE, as such, compounds 151,152 and 153 were 2.4, 2.1 and 3.5 times more potent respectively and are the known potent compounds to date and which were also found to be irreversible inhibitors (Ahmed et al, 2002).

| Compound | $\mathrm{IC}_{50}(\mu \mathrm{M})$ at $[\mathrm{S}]=50 \mu \mathrm{M}$ |
| :---: | :---: |
| 146 | $254 \pm 10.1$ |
| 147 | $302 \pm 6.7$ |
| 148 | $116.4 \pm 4.2$ |
| 149 | $39.8 \pm 1.4$ |
| 150 | $20.9 \pm 0.38$ |
| 151 | $5.0 \pm 0.36$ |
| 152 | $5.6 \pm 0.19$ |

### 1.11 Basis of present investigation

Androgens have been proposed as key endocrine factors for the initiation and progression of hormone-dependent diseases such as prostate and breast cancer. One of the methods of treatment is the deprivation of hormones by the inhibition of enzymes involved in androgen and estrogen biosynthesis, in particular, the $17 \beta$-HSD (more specifically isozyme type 3 ) and ES family of enzymes.

Extensive work has been carried out to develop highly potent and selective inhibitors of $17 \beta$-HSD3 and ES. It is thought that the development of inhibitors for these enzymes may lead to an improvement in the treatment for hormonedependent diseases. Although extensive work has been undertaken in this area, there is a need for further development, since only a few compounds have been shown to be suitable for clinical trials.

The aim of the present investigation involves the synthesis of potential inhibitors of both $17 \beta$-HSD3 (Figure 1.43a) and ES (Figure 1.43b) based on the compounds shown in Figure 1.43. The compounds will then undergo biochemical evaluation to determine the potency of these compounds against the two enzymes.

## CHAPTER 2

## Synthesis of

## 4-hydroxyphenyl ketones and their derivatives

### 2.1 Discussion

From initial molecular modelling studies, it was suggested that the carbonyl moiety may be a good mimic of the steroid $\mathrm{C}(17)=\mathrm{O}$ functional group (Owen and Ahmed, 2004). As such, we undertook the synthesis of the 4 hydroxyphenyl ketones and its derivatives according to Scheme 2.1. In an attempt to study the effects of the removal/substitution of the 4-hydroxy moiety, we also undertook the sulfonation of the phenolic moiety as outlined in Scheme 2.1.

The synthesis of the 4-hydroxyphenyl ketones involves acylation of the phenol moiety through the Friedel-Crafts acylation reaction. In this particular reaction, the phenol is allowed to initially react with the excess aluminium chloride $\left(\mathrm{AlCl}_{3}\right)$. In reactions involving non-hydroxylated phenyl derivatives, the acyl chlorides are often allowed to complex with the $\mathrm{AlCl}_{3}$ prior to the addition of the phenyl compound. It is postulated that as a result of the initial interaction between phenol and $\mathrm{AlCl}_{3}$ leads to the formation of a complex between the phenolic oxygen and the $\mathrm{AlCl}_{3}$. The complex formed is postulated to firstly reduce the possibility of ester formation on the addition of the acid chloride. Secondly, and more importantly, the bulky nature of the complex is thought to sterically hinder the ortho positions of the aromatic ring system. As such, only the para-substituted product would be expected to be produced.

Furthermore, for the Friedel-Crafts acylation reaction to take place, an acylium ion is required to be formed as a result of the reaction between acyl chloride and $\mathrm{AlCl}_{3}$, which then undergoes nucleophilic attack by the phenyl ring, as such, excess $\mathrm{AlCl}_{3}$ is required to be used (Fessenden and Fessenden, 1993). The acylium ion is resonance stabilised, as such, rearrangement of the acylium ion is not observed where as with Friedel-Crafts alkylation (where a carbocation formation is a requirement) rearrangement, so as to produce the more stable carbocation, is observed for alkyl chains containing greater than a $\mathrm{C}_{3}$ moiety.

The acylation step in Scheme 2.1 was found to proceed, in general, without any major problems and the 4-hydroxyphenyl ketone products (compounds 158 to 172) were obtained in poor to good yields, ranging from $\sim 14 \%$ for the 1-(4-hydroxy-phenyl)-decan-1-one (166) to $\sim 53 \%$ for 1-(4-hydroxy-phenyl)-propan-1-one (159) after purification involving column chromatography or recrystallisation. Furthermore, under the Friedel-Crafts reaction conditions used within the current study, no ortho substitution product was observed. Also, no disubstitution (or indeed any other polysubstitution) products were observed. This is presumably due to the electron withdrawing ability of the carbonyl group thereby leading to the deactivation of the phenyl ring system by the carbonyl group.

\end{array}
$$

Scheme 2.1: Synthesis of 4-hydroxyphenyl ketones ( $a=D C M / R C O C I / A_{C l}^{3}$; $\mathrm{R}=$ alkyl chain from $\mathrm{C}_{1}$ to $\mathrm{C}_{12}$ and cycloalkyl groups).

The yields for the larger alkyl chain containing compounds were presumed to be due to the extraction procedure where sodium hydroxide is used to generate the sodium salt of the phenol and it is presumed that with the larger alkyl containing compounds, the increased hydrophobicity due to the alkyl chain resulted in a lowering of the amount of compound being extracted into the sodium hydroxide layer, thereby resulting in reduced yield.

With regards to the cyclo derivatives (compounds 169 to 172), we observe that the yield ranges from $\sim 18 \%$ for the cycloheptyl-(4-hydroxyphenyl)methanone (172) to $45 \%$ for the cyclopentyl-(4-hydroxyphenyl)-methanone (170) and cyclohexyl-(4-hydroxyphenyl)-methanone (171). The poor yield obtained for 172, appears not to be related to the hydrophobicity as the corresponding acyl chloride was required to be synthesised from the carboxylic acid and which presumably did not go to completion or was hydrolysed during the removal of the excess thionyl chloride.

### 2.1.1 Synthesis of derivatives of 4-hydroxyphenyl ketones

In the synthesis of derivatives of 4-hydroxyphenyl ketones, the reactions outlined in Scheme 2.2 were undertaken to produce the different derivatives.

$$

Scheme 2.2: Synthesis of derivatives of sulfamic acid phenyl esters and sulfamic acid 2,6 -dibromophenyl esters ( $a=$ toluene/TEA/R'SO $\mathrm{S}_{2} \mathrm{Cl} / \Delta$; $\mathrm{R}=a \mathrm{lkyl}$ chain from $\mathrm{C}_{1}$ to $\mathrm{C}_{12}$ and cycloalkyl groups; $\mathrm{R}^{\prime}=\mathrm{CH}_{3}$ and $\mathrm{NH}_{2}$ ).

In general, the reactions involved the reaction of the 4-hydroxyphenyl ketone with the appropriate sulfonyl chloride using anhydrous conditions to give the corresponding sulfonated derivatives. The reactions were found to progress well in good yield. For example, in the synthesis of the methanesulfonate derivatives (compounds 173 to 189), the reaction between methanesulfonyl chloride and the appropriate 4 -hydroxyphenyl ketones lead to the synthesis of the target compounds in low to good yields, the low yield ranging from 15\%, [for methanesulfonic acid 4-undecanoyl-phenyl ester (184)] to an excellent yield of $97 \%$ [for methanesulfonic acid 4-octanoyl-phenyl ester and methanesulfonic acid 4-nonanoyl-phenyl ester (181 and 182)].

However, in the synthesis of the sulfamate derivatives (compounds 192 to 201), the reaction between 4 -hydroxyphenyl ketones and aminosulfonyl chloride did lead to some problems which have previously been reported (Scheme 2.2). In general, this reaction proved to be troublesome and led to poor yields, however, the poor yield is though to be due to the poor stability of both the aminosulfonyl chloride and the target compound. Moreover, aminosulfonyl chloride is not readily available commercially, due to its rapid degradation (James, 2000); it was therefore synthesised in situ prior to immediate use (Scheme 2.3).

Scheme 2.3. Formation of aminosulfonyl chloride.

The reaction leading to the formation of the aminosulfonyl chloride (Scheme 2.3) is believed to involve an initial nucleophilic attack (by the methanoic acid) on the chlorosulfonyl isocyanate, resulting in an intermediate which undergoes decarbonylation and decarboxylation to give aminosulfonyl chloride. In their synthesis of aminosulfonyl chloride, Appel and Berger
(1958) extracted the product into benzene, filtered, and removed the solvent under vacuum. In the present study, benzene was replaced with anhydrous toluene, resulting in a problem involving the removal of the high boiling point solvent. That is, toluene could not be removed at room temperature and any heating resulted in the degradation of the product, as a consequence, the product was not purified and was left in solution in toluene.

As previously mentioned, the synthesis of aminosulfamate has been extensively studied within our group and the initial synthesis of the sulfamate derivatives of the 4-hydroxyphenyl ketones was initially attempted using sodium hydride $(\mathrm{NaH})$ as a base for the reaction (James, 2000; Patel, 2003), in a similar manner to Woo et al (1996). However, we discovered that an undesired dimethylformamide (DMF) adduct was formed (Scheme 2.4). The so called 'DMF adduct' had previously been reported by Shwarz et al (1996). In their report, the authors proposed that the DMF adduct was formed through the attack on the carbonyl carbon atom of DMF by the lone pair of electrons on the nitrogen atom of the aminosulfonate group, followed by the dehydration of the product during the work up to give the imine type product (Scheme 2.4) (Woo et al, 1998).

Scheme 2.4. The formation of the DMF adduct.

As a result, alternative methods of sulfamoylation were investigated and it was found by Patel $\left(2003^{\text {a }}\right)$ that by using a weak base such as anhydrous potassium carbonate $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$ was used, successful synthesis of the sulfamates was achieved, but in very poor yields (generally less than $10 \%$ ).

Okada et al (2000) discovered a successful method of sulfamoylation which did not involve the use of any base and as such possessed the possibility of obtaining the target aminosulfonated compound without the production of the DMF adduct. In their study, the authors considered both the change in base and solvent in an attempt to increase the yield, however, they concluded that the use of $\mathrm{N}, \mathrm{N}$-dimethylacetamide (DMA) as the solvent in the absence of a base was enough to obtain the target compounds in relatively high yield.

More specifically, in an attempt to optimise their results, the authors studied both the amounts of base and aminosulfonyl chloride used in varying quantities. They found that the solvent used for the reaction had a profound effect on the rate of sulfamoylation and in particular, they found that the use of DMA alone resulted in not only a faster reaction but also had minimal byproduct formation. Elimination of a base altogether led to the highest yields compared to that of a sulfamoylation reaction with both solvent and base present. The authors also suggested that the formation of the DMF adduct is attributed to a competing reaction between DMF and aminosulfonyl chloride and that since the $\alpha$-proton in DMF is replaced in DMA with a methyl group (Figure 2.1). DMA therefore possesses a greatly reduced reactivity for the competing reaction, thereby eliminating the competing side reaction and therefore removing any possibility of DMA-adduct formation.

DMF

DMA

Figure 2.1: Comparisons between DMF and DMA.

In our hands, no problems were encountered using DMA and as such, all of the sulfamoylation reactions of the 4-hydroxyphenyl ketones were undertaken using the above method (Scheme 2.4) and the reactions proceeded smoothly, however, in poor to moderate yields ranging from $5 \%$ [for sulfamic acid 4 -
acetyl-phenyl ester (192)] to 33\% [for sulfamic acid 4-propionyl-phenylester (193)].

### 2.2 EXPERIMENTAL

### 2.3 MATERIALS AND METHOD

Chemicals were purchased from Sigma-Aldrich Company Ltd (Poole, Dorset, England) and from Lancaster (Morecambe, Lancashire, England). Structure elucidation was checked by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR ( JEOL 400 MHz and 100 MHz or Brucker 300 MHz and 75.5 MHz respectively) using either $\mathrm{CDCl}_{3}$, or $d_{6}$-acetone as solvent. Infrared spectrometry was carried out on a Perkin-Elmer Fourier Transform-Paragon 1000 infrared spectrometer. Gas chromatography-mass spectrometry was carried out on a Hewlett 5890 Packard series II GC-MS at a flow rate of $0.58 \mathrm{~mL} / \mathrm{min}$, and a temperature range increasing from $120-270^{\circ} \mathrm{C}$ at the rate of $10^{\circ} \mathrm{C} / \mathrm{min}$. Melting points are uncorrected and were obtained on a BUCHI 512 or a Gallenkamp instrument. Elemental analysis was undertaken at the School of Pharmacy, London, and high-resolution mass spectrometry was undertaken at Kings College, London.

### 2.4 Synthesis of 1-(4-hydroxy-phenyl)-ketones

1-(4-Hydroxy-phenyl)-ethanone (158)

Aluminium chloride $(1.50 \mathrm{~g}, 21 \mathrm{mmol})$ was added to a solution of phenol $(0.50 \mathrm{~g}$, 10.6 mmol ) in anhydrous dichloromethane (DCM) ( 10 mL ). The slurry was left stirring for 30 min before acetyl chloride ( $0.83 \mathrm{~mL}, 11.7 \mathrm{mmol}$ ) was added in a dropwise manner. The solution was then left to stir for 14 h . The reaction was quenched using an ice-cold solution of aqueous hydrochloric acid (HCl) (1M, 30 mL ) and then extracted into diethyl ether ( $2 \times 50 \mathrm{~mL}$ ). The combined organic layers were extracted into sodium hydroxide solution $(\mathrm{NaOH})(2 \mathrm{M}, 2 \times 50 \mathrm{~mL})$ and then acidified to pH 2 using aqueous $\mathrm{HCl}(1 \mathrm{M})$. The crude product was
extracted into diethyl ether ( $2 \times 50 \mathrm{~mL}$ ) and the organic layer was washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$ and dried over anhydrous magnesium sulfate $\left(\mathrm{MgSO}_{4}\right)$. The solution was filtered and the solvent was removed in vacuo to give a brown solid. Flash chromatography of the crude solid gave 158 as a white solid ( $0.68 \mathrm{~g}, 47.00 \%$ yield) [m.p. $109.8-110.1^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.26$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $110 \cdot 2-110.4^{\circ} \mathrm{C}$ (Buehler et al, 1937)].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 3321.93(\mathrm{OH}), 1662.55(\mathrm{C}=\mathrm{O}), 1603.51(\mathrm{Ar} \mathrm{C=C}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right)$ : $7.89(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.91(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 2.56(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 198.59$ ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 160.74, 131.19, 129.55, 115.51 ( $\left.\mathrm{Ar} \underline{\mathrm{C}}\right), 26.29$ $\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 6.06 \mathrm{~min} ;$ LRMS (EI): $136\left(M^{+}, 30 \%\right), 121\left(M^{+}-\mathrm{CH}_{3}, 100 \%\right)$; Elemental analysis: Found $\mathrm{C}, 70.42 \% ; \mathrm{H}, 5.88 \% ; \mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}_{2}$ requires $\mathrm{C}, 70.58 \%$; H, 5.92\%.

1-(4-Hydroxy-phenyl)-propan-1-one (159)

Compound 159 was synthesised in a similar manner to 158 except that propanoyl chloride $(1.02 \mathrm{~mL}, 11.7 \mathrm{mmol})$ was used in place of acetyl chloride. Flash chromatography of the crude solid gave 159 as an off- white solid $\left(0.84 \mathrm{~g}, 52.83 \%\right.$ yield) [m.p. $158.2-158.6^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.32$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $152-153^{\circ} \mathrm{C}$ (Aulin-Erdtman and Sanden, 1968)].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 3222.83(\mathrm{OH}), 1650.16(\mathrm{C}=\mathrm{O}), 1605.78(\mathrm{Ar} \mathrm{C=C}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right)$ : $7.85(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.42 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.81(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.42 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 2.89(2 \mathrm{H}, \mathrm{q}$, $\left.J_{A B}=7.32 \mathrm{~Hz}, J_{A B}=7.14 \mathrm{~Hz}, O=C-C \underline{H}_{2}\right), 1.15\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}_{A B}=7.14 \mathrm{~Hz}, \mathrm{~J}_{A B}=7.32 \mathrm{~Hz}\right.$, $\mathrm{CH}_{2} \mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 198.96$ ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 152.58, 130.56, 115.26 ( $\mathrm{Ar} \underline{\mathrm{C}}$ ), 31.39
$\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 8.38\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 6.81 \mathrm{~min} ;$ LRMS (EI): $150\left(M^{+}, 9 \%\right), 121\left(M^{+}-\right.$ $\mathrm{CH}_{3} \mathrm{CH}_{2}, 100 \%$ ); Elemental analysis: Found C, $71.84 \% ; \mathrm{H}, 6.71 \% ; \mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}_{2}$ requires $\mathrm{C}, 71.98 \% ; \mathrm{H}, 6.71 \%$.

## 1-(4-Hydroxy-phenyl)-butan-1-one (160)

Compound 160 was synthesised in a similar manner to 158 except that butyryl chloride ( $1.22 \mathrm{~mL}, 11.7 \mathrm{mmol}$ ) was used in place of acetyl chloride. Flash chromatography of the crude solid gave 160 as a white solid $(0.74 \mathrm{~g}$, $42.53 \%$ yield) [m.p. $99.6-100.0^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.29$ diethyl ether/petroleum ether $40-$ $60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $93-94^{\circ} \mathrm{C}$ (Krausz and Martin, 1965)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3370.69(\mathrm{OH}), 2963.17(\mathrm{CH}), 1660.27(\mathrm{C}=\mathrm{O}), 1601.95$ (Ar $\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 7.89(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.90(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.70 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}})$, $2.89\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=7.51 \mathrm{~Hz}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 1.74\left(2 \mathrm{H}, \mathrm{sex}, \mathrm{J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}\right.$, $\left.\mathrm{J}_{\mathrm{AB}}=7.51 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.98\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}_{\mathrm{AB}}=7.51 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta \mathrm{C}_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right):$ 200.89 ( $\mathrm{C}=\mathrm{O}$ ), 159.98, 130.81, 129.30, 115.43 ( $\operatorname{Ar} \underline{\mathrm{C}}), 40.25\left(\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 18.17$ $\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 13.90\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 7.40 \mathrm{~min} ;$ LRMS (EI): $164\left(M^{+}, 11 \%\right), 121\left(M^{+}-\right.$ $\mathrm{C}_{3} \mathrm{H}_{7}, 100 \%$ ); Elemental analysis: Found $\mathrm{C}, 73.07 \% ; \mathrm{H}, 7.29 \% ; \mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{2}$ requires $\mathrm{C}, 73.15 \%$; $\mathrm{H}, 7.37 \%$.

Compound 161 was synthesised in a similar manner to 158 except that pentanoyl chloride ( $1.40 \mathrm{~mL}, 11.7 \mathrm{mmol}$ ) was used in place of acetyl chloride. Flash chromatography of the crude solid gave 161 as a white solid $(0.78 \mathrm{~g}$, $41.27 \%$ yield) [m.p. $62.5-63.3^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.27$ diethyl ether/petroleum ether $40-$ $60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $62-63^{\circ} \mathrm{C}$ (Coulthard et al, 1930)].

## Cyclohexyl-(4-hydroxyphenyl)-methanone (171)

Compound 171 was synthesised in a similar manner to 158 except that cyclohexane carbonyl chloride ( $1.57 \mathrm{~mL}, 11.7 \mathrm{mmol}$ ) was used in place of acetyl chloride. Flash chromatography of the crude solid gave 171 as a white
solid $\quad\left(0.97 \mathrm{~g}, \quad 44.81 \%\right.$ yield) [m.p. 104.7-105. $2^{\circ} \mathrm{C} ; \quad \mathrm{R}_{\mathrm{f}} \quad 0.25$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $110.0-111.2^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3285.51(\mathrm{OH}), 2931.61(\mathrm{CH}), 1651.24(\mathrm{C}=\mathrm{O})$, 1601.63 (Ar $\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 7.89(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.91(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}})$, 3.18-3.24 (1H, m, $\mathrm{O}=\mathrm{C}-\mathrm{CH}$, cyclo $), 1.37\left[10 \mathrm{H}, \mathrm{m}, \mathrm{CH}-\left(\mathrm{CH}_{2}\right)_{5}\right.$, cyclo]; $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right)$ : $203.59(\underline{\mathrm{C}}=\mathrm{O}), 160.44,131.19,115.45$ ( $\mathrm{Ar} \underline{\mathrm{C}}$ ), 45.17 ( $\mathrm{O}=\mathrm{C}-\underline{\mathrm{C}} \mathrm{H}$ ), 29.59 [( $\left.\mathrm{CH}_{2}\right)_{2}$, cyclo], $25.90\left[\left(\mathrm{CH}_{2}\right)_{3}\right.$, cyclo]; GC: $\mathrm{t}_{\mathrm{R}} 9.74 \mathrm{~min} ;$ LRMS (EI): 204 $\left(M^{+}, 9 \%\right), 121\left(M^{+}-\mathrm{C}_{6} \mathrm{H}_{11}, 100 \%\right)$.

## Cycloheptyl-(4-hydroxyphenyl)-methanone (172)

Thionyl Chloride ( 1.53 mL ) was added dropwise to a solution of cycloheptanoic acid $(2.00 \mathrm{~g})$ in anhydrous toluene $(50 \mathrm{~mL})$. The reaction mixture was refluxed for 3 h . After that time, the reaction mixture was cooled down to room temperature and toluene washes were carried out until there was no further trace of thionyl chloride present. Cycloheptanoyl chloride ( $1.7 \mathrm{~g}, 11.7 \mathrm{mmol}$ ) was obtained as a dark brown oil, which was then used immediately in place of acetyl chloride. Flash chromatography of the crude solid gave 172 as a white solid ( $0.41 \mathrm{~g}, 17.67 \%$ yield) [m.p. $119.4-119.7^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.41$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(50: 50)$ ].
$v_{(\text {max) })}$ (Film) $\mathrm{cm}^{-1}: 3319.02(\mathrm{OH}), 2924.31(\mathrm{CH}), 1649.02(\mathrm{C}=\mathrm{O})$, 1601.03 ( $\mathrm{Ar} \mathrm{C=C}$ ); $\delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.83(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.86(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 3.31-$ $3.37(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{C}-\mathrm{CH}), 1.81-1.88\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{2}\right.$, cyclo $), 1.69-1.77(2 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2}$, cyclo $), 1.51-1.58\left[8 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{4}\right.$, cyclo]; $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 204.32$ ( $\mathbf{C}=\mathrm{O}$ ),
160.34, 131.14, 129.15, 115.61 ( $\operatorname{Ar} \underline{C}$ ), 46.47 ( $\mathrm{O}=\mathrm{C}-\underline{\mathrm{C}} \mathrm{H}$, cyclo), 31.21 ( $\mathrm{O}=\mathrm{C}-$ $\mathrm{CH}_{\mathrm{CH}}^{2} 2$, cyclo), 28.32 ( $\mathrm{CH}_{2}$, cyclo), 26.97 [( $\left.\mathrm{CH}_{2}\right)_{4}$, cyclo]; GC: $\mathrm{t}_{\mathrm{R}} 19.79 \mathrm{~min} ;$ LRMS (EI): $218\left(M^{+}, 3 \%\right), 121\left(M^{+}-\mathrm{C}_{7} \mathrm{H}_{13}, 100 \%\right)$. Elemental analysis: Found $\mathrm{C}, 77.08 \% ; \mathrm{H}, 8.31 \% ; \mathrm{C}_{14} \mathrm{H}_{18} \mathrm{O}_{2}$ requires $\mathrm{C}, 77.03 \% ; \mathrm{H}, 8.31 \%$.

### 2.5 Synthesis of methanesulfonic acid 4-alkyl-phenyl esters

Methanesulfonic acid 4-benzoyl-phenyl ester (173)

Methane sulfonyl chloride ( $0.23 \mathrm{~mL}, 0.128 \mathrm{~mol}$ ) was added dropwise to a stirred solution of 4 -hydroxybenzophenone $(0.53 \mathrm{~g}, 0.106 \mathrm{~mol})$, in triethylamine (TEA) $(0.39 \mathrm{~mL}, 0.117 \mathrm{~mol})$, and $\mathrm{DCM}(50 \mathrm{~mL})$ at room temperature. The resulting mixture was then refluxed for 3 h . After cooling to room temperature, it was quenched in ice, washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$, and cold saturated sodium bicarbonate $\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)(3 \times 20 \mathrm{~mL})$. The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$ and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was then filtered and removal of the solvent in vacuo gave 173 as an off-white solid ( $0.63 \mathrm{~g}, 85.14 \%$ yield) [m.p. $108.3-108.8^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.43$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(70: 30)$; Lit. m.p. 102.5-104. $5^{\circ} \mathrm{C}$ (Patent, Boots Comp, 1979)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 1656.72(\mathrm{C}=\mathrm{O}), 1596.44(\mathrm{Ar} \mathrm{C=C}), 1370.32,1150.39(\mathrm{~S}=\mathrm{O})$; $\delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.81(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.72(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.42 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.55$ $\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}_{\mathrm{AB}}=8.60 \mathrm{~Hz}, \mathrm{~J}_{A B}=7.51 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}\right), 7.43\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}_{A B}=7.87 \mathrm{~Hz}, \mathrm{~J}_{A B}=7.32 \mathrm{~Hz}\right.$, $\mathrm{Ph}-\underline{\mathrm{H}}), 3.15\left(3 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{S}=\mathrm{O}-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 195.12$ ( $\mathrm{C}=\mathrm{O}$ ), 151.98, 137.12,

GC: $\mathrm{t}_{\mathrm{R}} 12.14 \mathrm{~min}$; LRMS (EI): $276\left(M^{+}, 84 \%\right), 199\left(M^{+}-\mathrm{C}_{6} \mathrm{H}_{5}, 100 \%\right)$; HRMS (EI): Found 299.0349, $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{O}_{4} \mathrm{Na}_{1} \mathrm{~S}_{1}$ requires 299.3133.

## Methanesulfonic acid 4-formyl-phenyl ester (174)

Compound 174 was synthesised in a similar manner to 173 except methane sulfonyl chloride $(0.38 \mathrm{~mL}, 0.128 \mathrm{~mol})$, 4-hydroxybenzaldehyde $(0.54 \mathrm{~g}$, $0.106 \mathrm{~mol})$ and TEA ( $0.63 \mathrm{~mL}, 0.117 \mathrm{~mol}$ ) were used. The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$ and dried over anhydrous $\mathrm{MgSO}_{4}$. The solution was then filtered and removal of the solvent in vacuo gave 174 as a brown solid $\left(0.70 \mathrm{~g}, 79.55 \%\right.$ yield) [m.p. $68.2-68.7^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.27$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(70: 30)$; Lit. m.p. $64-65^{\circ} \mathrm{C}$ (Looker and Hayes, 1957)].
$v_{(\text {max })}($ Film $) \mathrm{cm}^{-1}: 1696.97(\mathrm{C}=0), 1598.16,1590.08$ ( $\mathrm{ArC}=\mathrm{C}$ ), 1363.11, $1146.58(\mathrm{~S}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 9.96(1 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{C}-\mathrm{H}), 7.90(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}})$, $7.40(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.60 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 3.15\left(3 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{S}=\mathrm{O}-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 190.61$ ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 153.35, 135.15, 131.72, 122.73 ( $\mathrm{Ar} \underline{\mathrm{C}}$ ), $38.17\left(\mathrm{O}=\mathrm{S}=\mathrm{O}-\mathrm{CH}_{3}\right.$ ); GC: $\mathrm{t}_{\mathrm{R}}$ $7.87 \mathrm{~min} ;$ LRMS (EI): $200\left(M^{+}, 77 \%\right), 121\left(M^{+}-\mathrm{CH}_{3} \mathrm{SO}_{2}, 100 \%\right)$.

Compound 175 was synthesised in a similar manner to 173 except methane sulfonyl chloride $(0.68 \mathrm{~mL}, 0.128 \mathrm{~mol})$, compound $158(1.07 \mathrm{~g}, 0.106 \mathrm{~mol})$, and TEA $(1.13 \mathrm{~mL}, 0.117 \mathrm{~mol})$ were used. The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$ and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered and removal of the solvent in vacuo gave 175 as an off-white solid $1.01 \mathrm{~g}, 70.14 \%$ yield) [m.p. $76.1-76.7^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.11$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (50:50); lit. m.p. $72-73^{\circ} \mathrm{C}$ (James, 2000)].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 1682.08(\mathrm{C}=\mathrm{O}), 1596.39(\mathrm{ArC}=\mathrm{C}), 1373.01,1156.31(\mathrm{~S}=\mathrm{O})$; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 7.96(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.31(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 3.13$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{S}=\mathrm{O}-\mathrm{CH}_{3}\right), 2.55\left(3 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 196.91$ ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 152.42, 135.80, 130.80, 122.17 ( $\mathrm{Ar} \underline{\mathrm{C}}$ ), $38.01\left(\mathrm{O}=\mathrm{S}=\mathrm{O}-\underline{\mathrm{C}}_{3}\right), 26.74$ ( $\mathrm{O}=\mathrm{C}$ $\left.\underline{\mathrm{C}}_{3}\right) ;$ GC: $\mathrm{t}_{\mathrm{R}} 8.61 \mathrm{~min} ;$ LRMS (EI): $183\left(M^{+}, 2 \%\right), 121\left(M^{+}-\mathrm{SOCH}_{2}, 100 \%\right)$.

Methanesulfonic acid 4-propionyl-phenyl ester (176)

Compound 176 was synthesised in a similar manner to 173 except methane sulfonyl chloride $(0.62 \mathrm{~mL}, 0.128 \mathrm{~mol})$, compound $159(1.02 \mathrm{~g}, 0.106 \mathrm{~mol})$, and

TEA ( $1.02 \mathrm{~mL}, 0.117 \mathrm{~mol}$ ) were used. The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$ and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered and removal of the solvent in vacuo gave a crude solid. Flash chromatography of the crude solid gave 176 as a white solid $(0.45 \mathrm{~g}, 29.03 \%$ yield) [m.p. $77.2-$ $77.6^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.17$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(50: 50)$; lit. m.p. 78 $79^{\circ} \mathrm{C}$ (James, 2000)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 1681.55(\mathrm{C}=\mathrm{O}), 1597.36(\mathrm{Ar} \mathrm{C=C}), 1369.28,1151.89(\mathrm{~S}=\mathrm{O})$; $\delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.97(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.31(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 3.13$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{S}=\mathrm{O}-\mathrm{CH}_{3}\right), 2.93\left(2 \mathrm{H}, \mathrm{q}, \mathrm{J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=7.14 \mathrm{~Hz}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 1.16$ $\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.14 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta \mathrm{c}\left(\mathrm{CDCl}_{3}\right)$ : 199.21 ( $\mathrm{C}=\mathrm{O}$ ), 152.16, 135.54, 130.17, 122.16 ( ArC ), $37.96\left(\mathrm{O}=\mathrm{S}=\mathrm{O}-\mathrm{CH}_{3}\right), 32.01\left(\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 8.21\left(\underline{\mathrm{C}}_{3}\right)$; $\mathrm{GC}: \mathrm{t}_{\mathrm{R}}$ $9.20 \mathrm{~min} ;$ LRMS (EI): $228\left(M^{+}, 9 \%\right), 199\left(M^{+}-\mathrm{C}_{2} \mathrm{H}_{5}, 100 \%\right)$. HRMS (EI): Found 251.0349. $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{4} \mathrm{Na}_{1} \mathrm{~S}_{1}$ requires 251.2687 .

## Methanesulfonic acid 4-butyryl-phenyl ester (177)

Compound 177 was synthesised in a similar manner to 173 except methane sulfonyl chloride ( $0.28 \mathrm{~mL}, 0.128 \mathrm{~mol}$ ), compound $160(0.50 \mathrm{~g}, 0.106 \mathrm{~mol})$, and TEA $(0.47 \mathrm{~mL}, 0.117 \mathrm{~mol})$ were used. The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$ and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was then filtered and removal of the solvent in vacuo gave 177 as an off-white solid $\left(0.70 \mathrm{~g}, 94.59 \%\right.$ yield) [m.p. $68.9-69.4^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.31$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(50: 50)$ ].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 1683.20$ (C=O), 1597.26 ( $\mathrm{ArC=C}$ ), 1374.41, 1155.58 ( $\mathrm{S}=\mathrm{O}$ ); $\delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.96(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.31(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 3.14$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{O}=\mathrm{S}=\mathrm{O}-\mathrm{CH}_{3}\right), 2.87\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}_{\mathrm{AB}}=7.14 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 1.71$ $\left(2 \mathrm{H}\right.$, sex, $\left.\mathrm{J}_{\mathrm{AB}}=7.51 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.94\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}_{\mathrm{AB}}=7.51 \mathrm{~Hz}\right.$, $\left.\mathrm{J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 198.95(\underline{\mathrm{C}}=\mathrm{O}), 152.16,136.06,130.23,122.15$ (Arㅡㄴ), $40.66\left(\mathrm{O}=\mathrm{S}=\mathrm{O}-\underline{\mathrm{C}} \mathrm{H}_{3}\right), 37.96\left(\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 17.73\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 13.92\left(\mathrm{CH}_{3}\right)$; GC: $t_{R} 9.68 \mathrm{~min} ;$ LRMS (EI): 242 ( $\left.M^{+}, 2 \%\right), 199\left(M^{+}-\mathrm{C}_{3} \mathrm{H}_{7}, 100 \%\right)$. ### 2.6 Synthesis of the sulfamic acid alkylphenyl ester derivatives

## Aminosulfonyl chloride (190)

Anhydrous chlorosulfonyl isocyanate ( $2 \mathrm{~mL}, \sim 0.23 \mathrm{~mol}$ ) was pipetted in an oven-dried pear-shaped flask under an atmosphere of nitrogen gas at $0^{\circ} \mathrm{C}$. Formic acid ( $0.75 \mathrm{~mL}, 0.02 \mathrm{~mol}$ ) was then carefully added dropwise resulting in the evolution of a gas and the formation of a white precipitate. The mixture was left to stir at $0^{\circ} \mathrm{C}$ for 30 min , after which anhydrous toluene was added, and the mixture was left to stir for a further 1 h after which, it was used for the next step below immediately without any purification.

## EMATE (191)

A solution of 190 in toluene ( $20 \mathrm{~mL}, \sim 0.23 \mathrm{~mol}$ ) was added to a stirred mixture of estrone $(0.74 \mathrm{~g}, 0.37 \mathrm{~mol})$ and DMA $(1 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was left stirring at $0^{\circ} \mathrm{C}$ for 3 h , after which it was poured into saturated brine solution $(50 \mathrm{~mL})$ and extracted into ethyl acetate $(2 \times 50 \mathrm{~mL})$. The organic phase was washed with brine ( $2 \times 25 \mathrm{~mL}$ ) and then dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered and the solvent was removed in vacuo to give 191 as a red-brown solid $\left(1.39 \mathrm{~g}, 60.00 \%\right.$ yield) [m.p. $195.4-197.3^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.30$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(70 / 30)$; lit. m.p. $195-197^{\circ} \mathrm{C}$ (Woo et al, 1998)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3366.4,3286.5\left(\mathrm{NH}_{2}\right), 1735.1(\mathrm{C}=\mathrm{O}), 1365.2,1179.8(\mathrm{~S}=\mathrm{O})$; $\delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.35(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.10(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 6.50$ ( $1 \mathrm{H}, \mathrm{d}, \mathrm{Ph}-\underline{\mathrm{H}}$ ), $5.00\left(2 \mathrm{H}, \mathrm{s}, \mathrm{N}-\mathrm{H}_{2}\right), 2.82-2.95\left(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 1.88-2.01$ $\left(13 \mathrm{H}, \mathrm{m}\right.$, steroid backbone), $0.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : $149.30(\mathrm{C}-\mathrm{O})$, 139.00, 138.00, 128.20, 122.50, 119.90 (Ar-Cㅡ), 50.00, 48.90, 43.90, 38.80, $35.11,31.40,29.85,25.90,25.10,21.88,13.90$ (steroid backbone).

## Sulfamic acid 4-acetyl-phenyl ester (192)

Compound 192 was synthesised in a similar manner to 191 except compound $158(0.51 \mathrm{~g}, 0.36 \mathrm{~mol})$ and DMA $(1.0 \mathrm{~mL})$ were used. The mixture was filtered and the solvent was removed in vacuo to give a crude solid. Flash column chromatography of the crude solid gave 192 as a white solid $(0.12 \mathrm{~g}, 4.81 \%$ yield) [ $\mathrm{m} . \mathrm{p}$. $124.4-124.9^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.14$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (50:50); lit. m.p. $123.5-125.5^{\circ} \mathrm{C}$ (Ahmed et al, 2002)].
$v_{\text {(max) }}($ Film $) \mathrm{cm}^{-1}: 3351.20,3187.64\left(\mathrm{NH}_{2}\right), 11670.97(\mathrm{C}=\mathrm{O}), 1595.20$ (Ar), 1384.78, 1182.81 (S=O); $\delta_{H}\left(d_{6}\right.$-Acetone): $8.07(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 7.44$ $(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.30\left(2 \mathrm{H}, \mathrm{brs}, \mathrm{NH} \underline{H}_{2}\right), 2.59\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(d_{6^{-}}\right.$ Acetone): $196.08(\underline{C}=\mathbf{O}), 154.09,135.60,130.08,121.21(\operatorname{Ar}-\underline{C}), 25.92\left(\mathrm{CH}_{3}\right)$.

## Sulfamic acid 4-propionyl-phenyl ester (193)

Compound 193 was synthesised in a similar manner as 191 except that compound 159 ( $0.51 \mathrm{~g}, 0.33 \mathrm{~mol}$ ) was used. The mixture was filtered and the solvent was removed in vacuo to give a crude oil. Flash column chromatography of the crude oil gave 193 as white crystals $(0.26 \mathrm{~g}, 33.33 \%$ yield) [m.p. $105.8-106.2^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.21$ (diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (40:60); lit. m.p. $106-107^{\circ} \mathrm{C}$ (Ahmed et al, 2002)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3380.10,3190.60,\left(\mathrm{NH}_{2}\right), 1681.28(\mathrm{C}=\mathrm{O}), 1599.18(\mathrm{Ar} \mathrm{C=C})$, 1383.63, $1182.26(\mathrm{~S}=\mathrm{O}) ; \delta_{H}\left(d_{6}\right.$-Acetone): 7.98 ( $\left.2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}\right), 7.34$ $(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.20(2 \mathrm{H}, \mathrm{brs}, \mathrm{NH} 2), 2.97(2 \mathrm{H}, \mathrm{q}, \mathrm{J}=7.14 \mathrm{~Hz}$, $\mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 1.05 ( $3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.14 \mathrm{~Hz}, \mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}\left(d_{6}\right.$-Acetone): 198.74 ( $\underline{C}=\mathrm{O}$ ), 153.96, 135.41, 129.74, 122.22 (Ar- $\underline{C}), 31.40\left(\mathrm{CH}_{2}\right), 7.57\left(\mathrm{CH}_{3}\right)$.

## Sulfamic acid 4-butyryl-phenyl ester (194)

Compound 194 was synthesised in a similar manner as 191 except that compound $160(0.50 \mathrm{~g}, 0.19 \mathrm{~mol})$ was used. The mixture was filtered and the solvent was removed in vacuo to give a crude oil. Flash column
chromatography of the crude oil gave 194 as white crystals $(0.13 \mathrm{~g}, 17.57 \%$ yield) [m.p. $95.1-95.6^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.23$ (diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (50:50); lit. m.p. $94-97^{\circ} \mathrm{C}$ (Ahmed et al, 2002)].
$v_{\text {(max) }}($ Film $) \mathrm{cm}^{-1}$ : $3349.29\left(\mathrm{NH}_{2}\right), 1676.95(\mathrm{C}=\mathrm{O}), 1597.18$ (Ar), 1381.60 ( $\mathrm{S}=\mathrm{O}$ ); $\delta_{\mathrm{H}}\left(\mathrm{d}_{6}\right.$-Acetone): 7.98 ( $2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}$ ), $7.34(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}$, Ph-H), $7.20\left(2 \mathrm{H}\right.$, brs, $\left.\mathrm{NH}_{2}\right), 2.92\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.14 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.62(2 \mathrm{H}$, sex, $\left.\mathrm{J}=7.32 \mathrm{~Hz}, \quad \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.88\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=7.51 \mathrm{~Hz}, \quad \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(d_{5}-\right.$ Acetone): 198.35 ( $\underline{C}=\mathbf{O}$ ), 153.97, 135.58, 129.81, 122.24 (Ar- $\underline{C}$ ), 40.06 $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 17.45\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 13.19\left(\mathrm{C}_{3}\right)$.

## Sulfamic acid 4-pentanoyl-phenyl ester (195)

Compound 195 was synthesised in a similar manner as 191 except that compound 161 ( $0.51 \mathrm{~g}, 0.28 \mathrm{~mol}$ ) was used. The mixture was filtered and the solvent was removed in vacuo to give a crude oil. Flash column chromatography of the crude oil gave 195 as a white crystals $(0.09 \mathrm{~g}, 12.16 \%$ yield) [m.p. $80.5-81.0^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.33$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (50:50); lit. m.p. $80-83^{\circ} \mathrm{C}$ (Ahmed et al, 2002)].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 3363.01\left(\mathrm{NH}_{2}\right), 1678.03(\mathrm{C}=\mathrm{O}), 1592.15(\mathrm{Ar} \mathrm{C}=\mathrm{C}), 1383.89$, $1182.43(\mathrm{~S}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(d_{6}\right.$-Acetone): $7.99(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.34(2 \mathrm{H}, \mathrm{d}$, $J=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.20\left(2 \mathrm{H}, \mathrm{brs}, \mathrm{NH}_{2}\right), 2.95\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}_{\mathrm{AB}}=7.14 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=7.32 \mathrm{~Hz}\right.$, $\left.\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 1.52-1.60\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.19-1.36\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.84$ $\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.32 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(d_{6}\right.$-Acetone): 198.45 ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 153.96, 135.57
129.82, 122.24 (Ar- $-\underline{C}$ ), $37.91\left[\mathrm{C}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 26.27\left(\mathrm{C}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.18$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 13.39\left(\mathrm{CH}_{3}\right)$.

## Sulfamic acid 4-hexanoyl-phenyl ester (196)

Compound 196 was synthesised in a similar manner as 191 except that compound 162 ( $0.52 \mathrm{~g}, 0.27 \mathrm{~mol}$ ) was used. The mixture was filtered and the solvent was removed in vacuo to give a crude solid. Flash column chromatography of the crude solid gave 196 as a white solid $(0.12 \mathrm{~g}, 16.44 \%$ yield) [m.p. $114.2-114.7^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.38$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (50:50); lit. m.p. 114.9-115.8 ${ }^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3391.03,3275.00\left(\mathrm{NH}_{2}\right), 2930.65(\mathrm{CH}), 1681.69(\mathrm{C}=\mathrm{O})$, 1378.61, $1181.85(\mathrm{~S}=\mathrm{O})$; $\delta_{H}\left(d_{6}\right.$-Acetone): $7.99(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.34$ $\left.(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.20(2 \mathrm{H}, \mathrm{brs}, \mathrm{NH})_{2}\right), 2.94(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.32 \mathrm{~Hz}, \mathrm{O}=\mathrm{C}-$ $\left.\mathrm{CH}_{2}\right), 1.52-1.65\left[2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 1.21-1.35\left[4 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 0.65-$ 0.87 (3H, m, $\mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}\left(\mathrm{d}_{6}\right.$-Acetone): 198.45 ( $\mathrm{C}=\mathrm{O}$ ), 153.96, 135.57, 129.82, 122.23 (Ar- $\underline{C}$ ), $38.14\left(\mathrm{O}=\mathrm{C}-\underline{\mathrm{C}} \mathrm{H}_{2}\right), 31.34\left(\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2} \mathrm{CH}_{2}\right), 23.82\left(\underline{\mathrm{C}} \mathrm{H}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $22.38\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 13.42\left(\mathrm{CH}_{3}\right)$.

Compound 197 was synthesised in a similar manner as 191 except that compound $163(0.50 \mathrm{~g}, 0.24 \mathrm{~mol})$ was used. The mixture was filtered and the solvent was removed in vacuo to give a crude solid. Flash column chromatography of the crude solid gave 197 as a white solid $(0.14 \mathrm{~g}, 20.29 \%$ yield) [m.p. $80.5-81.0^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.38$ (diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (50:50); lit. m.p. $80-84^{\circ} \mathrm{C}$ (Ahmed et al, 2002)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3390.21,3274.20\left(\mathrm{NH}_{2}\right), 2929.94(\mathrm{CH}), 1682.04$ (C=O), 1378.04, $1181.98(\mathrm{~S}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{d}_{6}\right.$-Acetone): $7.99(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 7.34$ $(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.20\left(2 \mathrm{H}\right.$, brs, $\left.\mathrm{NH}_{2}\right), 2.94(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.32 \mathrm{~Hz}, \mathrm{O}=\mathrm{C}-$ $\left.\mathrm{CH}_{2}\right), 1.52-1.67\left[2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 1.12-1.29\left[6 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 0.66-$ 0.88 (3H, m, $\mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}\left(d_{6}\right.$-Acetone): 198.46 ( $\mathrm{C}=\mathrm{O}$ ), 153.97, 135.57, 129.82, 122.23 ( $\mathrm{Ar}-\underline{\mathrm{C}}), 38.19\left(\mathrm{O}=\mathrm{C}-\underline{-} \mathrm{CH}_{2}\right), 31.62\left(\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2} \underline{\mathrm{C}} \mathrm{H}_{2}\right), 24.10\left(\underline{\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right) \text {, }}\right.$ $22.41\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 13.49\left(\mathrm{C}_{3}\right)$.

## Sulfamic acid 4-octanoyl-phenyl ester (198)

Compound 198 was synthesised in the same way as 191 except that compound $164(0.55 \mathrm{~g}, 0.25 \mathrm{~mol})$ was used. The mixture was filtered and the
solvent was removed in vacuo to give a crude solid. Flash column chromatography of the crude solid gave 198 as a white solid $(0.16 \mathrm{~g}, 21.33 \%$ yield) [m.p. $106.3-106.8^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.11$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (40:60); lit. m.p. $105-107^{\circ} \mathrm{C}$ (Ahmed et al, 2002)].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 3388.93,3272.56\left(\mathrm{NH}_{2}\right), 2918.44(\mathrm{CH}), 1682.14(\mathrm{C}=\mathrm{O})$, 1597.84 ( $\mathrm{Ar} \mathrm{C}=\mathrm{C}$ ), 1377.67, 1181.96 ( $\mathrm{S}=\mathrm{O}$ ); $\delta_{\mathrm{H}}\left(d_{6}\right.$-Acetone): $7.99(2 \mathrm{H}, \mathrm{d}$, $\mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.34(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.20(2 \mathrm{H}, \mathrm{brs}, \mathrm{NH} 2), 2.94(2 \mathrm{H}$, $\left.\mathrm{t}, \mathrm{J}=7.32 \mathrm{~Hz}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right)_{1}, 1.68-1.75\left(2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.25-1.37[8 \mathrm{H}, \mathrm{m}$, $\left.\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 0.79\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.14 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(d_{6}\right.$-Acetone): 198.48 ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 153.96 ( $\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}$ ), 135.57, 129.82, 122.23 ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), $38.19\left(\mathrm{O}=\mathrm{C}-\mathrm{C}_{2}\right)_{2}, 31.69$ $\left(\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2} \underline{\mathrm{C}}_{2}\right)^{2} 29.12\left[\mathrm{O}=\mathrm{C}-\left(\mathrm{CH}_{2}\right)_{2} \underline{\mathrm{C}}_{2}\right], 29.09 \quad\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], \quad 24.15$ $\left(\mathrm{C}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.47\left(\underline{\mathrm{C}} \mathrm{H}_{2} \mathrm{CH}_{3}\right), 13.51\left(\mathrm{C}_{3}\right)$.

Sulfamic acid 4-nonanoyl-phenyl ester (199)

Compound 199 was synthesised in the same way as 191 except that compound $165(0.52 \mathrm{~g}, 0.22 \mathrm{~mol})$ was used. The mixture was filtered and the solvent was removed in vacuo to give a crude solid. Flash column chromatography of the crude solid gave 199 as a white solid $(0.10 \mathrm{~g}, 14.29 \%$ yield) [m.p. $103.8-104.3^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.56$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (70:30); lit. m.p. $102-104^{\circ} \mathrm{C}$ (Ahmed et al, 2002)].
$v_{(\text {max })}($ Film $) \mathrm{cm}^{-1}: 3389.49,3273.87\left(\mathrm{NH}_{2}\right), 2917.25(\mathrm{CH}), 1683.23(\mathrm{C}=\mathrm{O})$, 1599.09 ( Ar ), $1378.13,1182.24(\mathrm{~S}=\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.97(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}$, PhH), $7.29(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.25\left(2 \mathrm{H}, \mathrm{brs}, \mathrm{NH}_{2}\right), 2.92(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}$,
$\left.\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2}\right), 2.79\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{O}=\mathrm{C}-\mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.16-2.20[2 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{C}-$ $\left.\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\right], 1.75\left[8 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz},\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 0.85\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ;$ $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : 189.06 ( $\underline{\mathrm{C}}=\mathbf{O}$ ), 160.69 (Ar- $\underline{\mathrm{C}}-\mathrm{O}$ ), 130.85, 129.73, 115.45, 96.44 (Ar-C), $38.39\left(\mathrm{O}=\mathrm{C}-\mathrm{C}_{2}\right), \quad 31.83\left(\mathrm{O}=\mathrm{C}-\mathrm{CH}_{2} \underline{\mathrm{C}}_{2}\right), \quad 24.83\left(\mathrm{C}_{2}\right), \quad 22.66$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 14.11\left(\mathrm{CH}_{3}\right)$.

## Sulfamic acid 4-cyclobutanecarbonyl-phenyl ester (200)

Compound 200 was synthesised in the same way as 191 except that compound $169(0.55 \mathrm{~g}, 0.31 \mathrm{~mol})$ was used. The mixture was filtered and the solvent was removed in vacuo to give a crude oil. Flash column chromatography of the crude oil gave $\mathbf{2 0 0}$ as white crystals $(0.26 \mathrm{~g}, 32.50 \%$ yield) [m.p. $101.9-102.4^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.52$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (40:60); lit. m.p. 101.2-102.5 ${ }^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3162.34\left(\mathrm{NH}_{2}\right), 2947.00(\mathrm{CH}), 1669.96(\mathrm{C}=\mathrm{O}), 1597.61$, 1499.81 (Ar), 1385.50, 1181.23 (S=O); $\delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.92(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97 \mathrm{~Hz}, \mathrm{Ph}-$ H), $7.34(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97, \mathrm{Ph}-\mathrm{H}), 7.23\left(2 \mathrm{H}, \mathrm{brs}, \mathrm{NH} \underline{H}_{2}\right), 4.01-4.09(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{C}-$ $\mathrm{CH}), ~ 2.74-2.80\left[4 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{2}\right.$, cyclo], 2.19-2.26 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{J}=7 \mathrm{~Hz}, \mathrm{CH}_{2}\right.$, cyclo); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 205.45(\underline{\mathrm{C}}=\mathrm{O}), 153.96$ ( $\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}$ ), 133.52, 130.11, 122.35 ( $\mathrm{Ar}-\mathrm{C}$ ), $41.94(\mathrm{O}=\mathrm{C}-\underline{\mathrm{CH}}), 24.74\left(\mathrm{CH}_{2}\right.$, cyclo $), 17.76\left(\mathrm{CH}_{2}\right.$, cyclo $)$.

## Sulfamic acid 4-cyclopentanecarbonyl-phenyl ester (201)

Compound 201 was synthesised in the same way as 191 except that compound $170(0.56 \mathrm{~g}, 0.29 \mathrm{~mol})$ was used. The mixture was filtered and the solvent was removed in vacuo to give a crude oil. Flash column chromatography of the crude oil gave 201 as a white solid $(0.20 \mathrm{~g}, 25.32 \%$ yield) [m.p. $103.8-104.3^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.59$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ (40:60); lit. m.p. 104.7-106.0º (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3266.33,3102.13\left(\mathrm{NH}_{2}\right), 2955.80(\mathrm{CH}), 1671.23(\mathrm{C}=\mathrm{O})$, 1596.74, 1499.66 ( $\mathrm{ArC=C}$ ), 1387.74, $1181.90(\mathrm{~S}=\mathrm{O}), 870.09 ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 8.01$ ( $2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.79 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.35(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.97, \mathrm{Ph}-\underline{\mathrm{H}}), 7.23$ ( $2 \mathrm{H}, \mathrm{brs}, \mathrm{N} \underline{H}_{2}$ ), 3.71-3.79 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{C}-\mathrm{CH}$ ), 1.95-1.97 [ $4 \mathrm{H}, \mathrm{m}, 2 \mathrm{X} \mathrm{CHCH}_{2}$, cyclo], 1.55-1.59 [4H, m, CHCH2, cyclo]; $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 205.43$ ( $\mathrm{C}=\mathrm{O}$ ), 153.89 (Ar- $\left.\mathrm{C}-\mathrm{O}\right), 135.24$, 130.28, 122.28 (Ar-C), 46.10 ( $\mathrm{O}=\mathrm{C}-\underline{-} \mathrm{H}$ ), 28.66 [( $\left(\mathrm{CH}_{2}\right) 4$, cyclo].

## CHAPTER 3

## Synthesis of 1-biphenyl-4-yl-ketones and 1-(4-cyclohexyl-phenyl)ketones

### 3.0 Synthesis of 1-biphenyl-4-yl ketones and 1-(4-cyclohexyl-phenyl)-

 ketones
### 3.1 Discussion

The 1-biphenyl-4-yl ketones and 1-(4-cyclohexyl-phenyl)-ketones were synthesised using the general reaction scheme 3.1 below:

Where $\mathrm{R}=\mathrm{Ph}$
$R^{1}=\mathrm{C}_{2} \mathrm{H}_{3}$, (202)
$\mathrm{R}^{1}=\mathrm{C}_{3} \mathrm{H}_{5}$, (203)
$\mathrm{R}^{1}=\mathrm{C}_{4} \mathrm{H}_{7}$, (204)
$\mathrm{R}^{1}=\mathrm{C}_{5} \mathrm{H}_{9}$, (205)
$\mathrm{R}^{1}=\mathrm{C}_{6} \mathrm{H}_{11}$, (206)
$\mathrm{R}^{1}=\mathrm{C}_{7} \mathrm{H}_{13}$ (207)
$\mathrm{R}^{1}=\mathrm{C}_{8} \mathrm{H}_{15}$, (208)
$\mathrm{R}^{1}=\mathrm{C}_{9} \mathrm{H}_{17}$, (209)
$\mathrm{R}^{1}=\mathrm{C}_{10} \mathrm{H}_{19}$, (210)
$\mathrm{R}^{1}=\mathrm{C}_{12} \mathrm{H}_{23}$, (211)
$\mathrm{R}^{1}=\mathrm{C}_{4} \mathrm{H}_{7}$ (Cyclo), (212)
$\mathrm{R}^{1}=\mathrm{C}_{5} \mathrm{H}_{9}$ (Cyclo), (213)
$\mathrm{R}^{1}=\mathrm{C}_{6} \mathrm{H}_{11}$ (Cyclo), (214)

Where $\mathrm{R}=$ Cyclohexyl

Scheme 3.1 Scheme outlining the synthesis of 1-biphenyl-4-yl ketones ( $\mathrm{R}=\mathrm{Ph}$ ) and 1-(4-cyclohexyl-phenyl)-ketones $\left[(R=c y c l o h e x y l)\left(R^{1}=\right.\right.$ straight chain alkyl and cyclo alkyl moiety) ( $a=D C M / R C O C / / A I C l_{3} ; R^{1}=$ alkyl chain from $C_{2}$ to $C_{12}$ and cycloalkyl groups)].

The reaction involves Friedel-Crafts acylation as utilised in the synthesis of 4hydroxyphenyl ketones (Chapter 2; Scheme 2.1). In this particular reaction, however, the addition of the starting materials was different to that in the synthesis of the 4 -hydroxyphenyl ketones. That is, in the synthesis of the latter series of compounds, the phenol was added to the $\mathrm{AICl}_{3}$ initially and the
mixture was allowed to stir prior to the addition of the acyl chloride. In the synthesis of the 1-biphenyl-4-yl ketones and 1-(4-cyclohexyl-phenyl)-ketones, however, the lack of a hydroxy group meant that the initial complex formation between $\mathrm{AICl}_{3}$ and the phenolic oxygen atom was not required. As a result, the acyl chlorides were initially stirred with the $\mathrm{AlCl}_{3}$ prior to the addition of biphenyl (in the synthesis of 1-biphenyl-4-yl ketones) or the 4cyclohexylbenzene [in the synthesis of 1-(4-cyclohexyl-phenyl)-ketones]. Excess $\mathrm{AlCl}_{3}$ in the reaction is used as it forms a complex with the acyl functionality. The ketone product is also complexed with the $\mathrm{AlCl}_{3}$, however, the desired ketone can be liberated by the treatment of water during the 'work-up' (Fessenden and Fessenden, 1998). The use of the catalyst ensures that the acylation takes place on the carbon atom and not the oxygen atom, resulting in the formation of a carbonyl functionality which leads to the deactivation of the phenyl ring system and which in turn, results in the formation of the mono substituted product only. Furthermore, only the formation of a para substituted product is observed (as shown by the GC-MS and ${ }^{1} \mathrm{H}$-NMR) in the Friedel-Crafts reaction.

In general, the reactions proceeded in good yield and without major problems. For example, in the synthesis of 1-biphenyl-4-yl ketones, $98 \%$ yield was obtained in the synthesis for 1-biphenyl-4-yl-ethanone (202) whilst the lowest yield obtained was $35 \%$ for 1-biphenyl-4-yl-nonan-1-one (209) - it should be noted that most of these compounds were obtained in high purity upon workup. In the synthesis of 1-(4-cyclohexyl-phenyl)-ketones, $\sim 98 \%$ yield was obtained in the synthesis for 1-(4-cyclohexyl-phenyl)-hexan-1-one (219) whilst the lowest yield obtained was 19\% for 1-(4-Cyclohexyl)-phenyl)-dodecan-1one (224) - following column chromatography or recrystallisation. However, in the synthesis of the undecyl and cycloheptyl derivatives of both series of compounds, the appropriate acyl chlorides were not available, as such, the acyl chlorides were synthesised involving the reaction (under anhydrous conditions) between the appropriate carboxylic acid and an excess of thionyl chloride. The attempted synthesis of the undecyl and cycloheptyl derivatives were then carried out in a similar manner to the other ketone derivatives, that is, the appropriate acyl chloride was stirred with the $\mathrm{AICl}_{3}$ prior to the addition
of biphenyl or 4-cyclohexyl benzene. GC-MS analysis of the reaction mixture (involving the analysis of the MS fragmentation pattern of the peaks within the GC) showed the presence of the product, however, attempted column chromatography and recrystallisation yielded no pure product. Several attempts were made to synthesise the two missing compounds, however, the compounds could not be isolated and the synthesis of the undecyl and cycloheptyl derivatives were abandoned.

### 3.1.1 Synthesis of 1-biphenyl-4-yl ketones

## 1-Biphenyl-4-yl-ethanone (202)

Acetyl chloride $(0.46 \mathrm{~mL})$ was added in a dropwise manner to a solution of $\mathrm{AICl}_{3}(0.86 \mathrm{~g}, 21 \mathrm{mmol})$ in anhydrous DCM $(100 \mathrm{~mL})$. The slurry was left to stir for 30 min after which, biphenyl $(0.50 \mathrm{~g}, 10.6 \mathrm{~mol})$ was added. The reaction mixture was then left to stir for 14 h , after which it was quenched with a mixture of ice and water ( 150 mL ) and washed with aqueous $\mathrm{HCl}(0.5 \mathrm{M}, 2 \mathrm{X}$ $50 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$, saturated $\mathrm{NaHCO}_{3}$ solution $(50 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{X}$ 100 mL ). The combined organic layer was collected and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was then filtered, and the solvent was removed in vacuo to give 202 as a pale yellow solid. $\left(0.68 \mathrm{~g}, 97.69 \%\right.$ yield) [m.p $131.5-132.9^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.49$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit.m.p. $124.5-125^{\circ} \mathrm{C}$ (Takebayashi et al, 1970)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 1680.90(\mathrm{C}=\mathrm{O}), 1610.00(\mathrm{Ar} \mathrm{C=C}), 1358.40(\mathrm{CH}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right):$ $8.04(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.60 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.69(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.60 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.62(2 \mathrm{H}, \mathrm{d}$, $J=7.78 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.47\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}_{A B}=7.14 \mathrm{~Hz}, \mathrm{~J}_{A B}=7.69 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}\right), 2.64(3 \mathrm{H}, \mathrm{s}$, $\mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 198.01(\underline{\mathrm{C}}=\mathrm{O}), 145.65,139.51,135.68,128.94,128.89$, 128.07, 127.25, 127.20 ( $\operatorname{Ar} \underline{\mathrm{C}}$ ), 26.65 ( $\mathrm{C}_{3}$ ); GC: $\mathrm{t}_{\mathrm{R}} 8.93 \mathrm{~min}$; LRMS (EI): 196 ( $M^{+} \cdot 56 \%$ ), $181\left(M^{+}-\mathrm{CH}_{3}, 100 \%\right)$; Elemental analysis: Found $\mathrm{C}, 85.68 \%$; H, $6.08 \% ; \mathrm{C}_{14} \mathrm{H}_{12} \mathrm{O}$ requires $\mathrm{C}, 85.68 \% ; \mathrm{H}, 6.16 \%$.

Compound 203 was synthesised in a similar manner to 202 except that propionyl chloride ( $0.57 \mathrm{~mL}, 11.7 \mathrm{mmol}$ ) was used instead of acetyl chloride and biphenyl ( $0.56 \mathrm{~g}, 10.6 \mathrm{~mol}$ ) was used. The organic layer was collected and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered and the solvent was removed in vacuo to give 203 as a pale yellow solid ( $0.78 \mathrm{~g}, 97.44 \%$ yield) [m.p. $114.6-115.2^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.70$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $102^{\circ} \mathrm{C}$ (Hartung et al, 1935)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 2978.80(\mathrm{CH}), 1685.90(\mathrm{C}=\mathrm{O}), 1445.90(\mathrm{CH}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right)$ : $8.03(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.60 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.67(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.60 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.62(2 \mathrm{H}, \mathrm{d}$, $J=7.51 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.48\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}_{A B}=7.14 \mathrm{~Hz}, \mathrm{~J}_{A B}=7.69 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}\right), 3.04(2 \mathrm{H}, \mathrm{q}$, $\left.J_{A B}=8.60 \mathrm{~Hz}, J_{A B}=7.32 \mathrm{~Hz}, J_{A B}=5.86 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.25\left(3 \mathrm{H}, \mathrm{t}_{1} \mathrm{~J}_{\mathrm{AB}}=7.51 \mathrm{~Hz}\right.$, $\left.\mathrm{J}_{\mathrm{AB}}=7.14 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right) ; 200.11$ ( $\mathrm{C}=\mathrm{O}$ ), 145.39, 139.77, 135.68, 128.91, $128.55,128.14,127.21,127.19(\operatorname{Ar} \underline{\mathrm{C}}), 31.81\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 8.29\left(\mathrm{CH}_{3}\right) ; G C: t_{R}$ $9.56 \mathrm{~min} ; \operatorname{LRMS}(\mathrm{EI}): 210\left(M^{+}, 19 \%\right), 181\left(M^{+}-\mathrm{C}_{2} \mathrm{H}_{5}, 100 \%\right)$; Elemental analysis: Found $\mathrm{C}, 85.57 \% ; \mathrm{H}, 6.76 \% ; \mathrm{C}_{15} \mathrm{H}_{14} \mathrm{O}$ requires $\mathrm{C}, 85.68 \% ; \mathrm{H}$, 6.71\%.

Compound 204 was synthesised in a similar manner to 202 except that butyryl chloride ( $0.67 \mathrm{~mL}, 11.7 \mathrm{mmol}$ ) was used instead of acetyl chloride and biphenyl $(0.50 \mathrm{~g}, 10.6 \mathrm{~mol})$ was used. The organic layer was collected and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered and the solvent removed in vacuo to give $\mathbf{2 0 4}$ as a yellow solid ( $0.67 \mathrm{~g}, 77.01 \%$ yield) [m.p. $104.1-105.2^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.65$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $96-97^{\circ} \mathrm{C}$ (Cromwell et al, 1953)].

### 3.1.2 Synthesis of 1-(4-cyclohexyl-phenyl)-ketones

1-(4-Cyclohexyl-phenyl)-ethanone (215)

Acetyl chloride ( $0.44 \mathrm{~mL}, 21 \mathrm{mmol}$ ) was added in a drop wise manner to a solution of aluminium chloride $(0.86 \mathrm{~g}, 21 \mathrm{mmol})$ in anhydrous DCM ( 100 mL ). The slurry was left to stir for 30 min after which, cyclohexyl-benzene $(0.51 \mathrm{~g}$, 10.6 mmol ) was added. The reaction mixture was then left to stir for 14 h . The reaction was quenched using a mixture of ice and water ( 150 mL ) and washed with aqueous $0.5 \mathrm{M} \mathrm{HCl}(2 \times 50 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(1 \times 100 \mathrm{~mL})$, saturated $\mathrm{NaHCO}_{3}$ solution ( $1 \times 50 \mathrm{~mL}$ ) and $\mathrm{H}_{2} \mathrm{O}(2 \times 100 \mathrm{~mL})$. The combined organic layer was collected and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was then filtered, and the solvent was removed in vacuo to give 215 as a pale yellow solid ( $0.62 \mathrm{~g}, 96.88 \%$ yield) [m.p. $67.6-68.1^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.64$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit.m.p. $67-69^{\circ} \mathrm{C}$ (Mowry et al, 1946)].

The mixture was then filtered, and the solvent was removed in vacuo to give a crude solid. Recrystallisation of the crude solid from absolute alcohol gave 227 as a crystalline off-white solid ( $0.21 \mathrm{~g}, 26.25 \%$ yield) [m.p. $75.1-75.6^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}}$ 0.65 diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(10: 90)$ ].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 2925.99(\mathrm{CH}), 1671.28(\mathrm{C}=\mathrm{O}), 1604.12(\mathrm{Ar} \mathrm{C=C}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right)$ : $7.89(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.42 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.27(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.60 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 3.68$ ( 1 H, quin, $\mathrm{J}=7.87 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 2.50-2.57(1 \mathrm{H}, \mathrm{m}, \mathrm{O}=\mathrm{C}-\mathrm{CH}), 1.82-1.92\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right.$, cyclo $)$, 1.68-1.74 (2H, m, CH2, cyclo), 1.59-1.66 (2H, m, CH2, cyclo), 1.21-1.30 ( 2 H , $\mathrm{m}, \mathrm{CH}_{2}$, cyclo $) ; ~ \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right)$ : 199.46 ( $\left.\mathbf{C}=\mathrm{O}\right), 153.38,134.85,128.76,127.05$ (ArC), $46.33(\mathrm{O}=\mathrm{C}-\underline{\mathrm{C}} \mathrm{H}), 44.74\left(\underline{\mathrm{C}}_{2}\right.$, cyclo $), 34.21\left(\mathrm{C}_{2}, ~ c y c l o\right), 30.14\left(\mathrm{C}_{2}\right.$, cyclo), 26.83 ( $\underline{\mathrm{CH}}_{2}$, cyclo), 26.41 ( $\mathrm{CH}_{2}$, cyclo), $26.14\left(\underline{\mathrm{C}}_{2}\right.$, cyclo); $\mathrm{GC}: \mathrm{t}_{\mathrm{R}}$ $11.59 \mathrm{~min} ;$ LRMS (EI): $256\left(M^{+}, 1 \%\right), 187\left(M^{+}-\mathrm{C}_{5} \mathrm{H}_{9}, 100 \%\right)$.

## CHAPTER 4

## Attempted synthesis of sulfamate derivatives of 4- <br> hydroxybenzoic acid esters

### 4.0 Attempted synthesis of sulfamate derivatives of 4-hydroxybenzoic acid esters.

### 4.1 Discussion

As previously mentioned, the sulfamate moiety appears to possess potent inhibitory activity when attached to a phenyl ring system. More specifically, James (2000) has shown that 4-sulfamoylated derivatives of benzoic acid possess potent inhibition of ES. Furthermore, it was suggested that increasing the stability of the phenoxide ion may potentially lead to potent inhibitors of ES. In an attempt to increase the potency of inhibitors based on the benzoic acid backbone, we considered the synthesis of mono- and dibrominated derivatives, as such, in the synthesis of the sulfamate derivatives of the esters of 4-hydroxybenzoic acid, the reactions outlined in Scheme 4.1 were utilised:

Scheme 4.1: Synthesis of the sulfamate derivatives of esters of 4hydroxybenzoic acid ( $a=R O H / H^{+} / \Delta ; b=$ sulfamoyl chloride/DMA; $\mathrm{X}=\mathrm{H}$ or Br ; $\mathrm{n}=0,1$ or 2 ; $\mathrm{R}=$ alkyl and cycoalkyl moiety).

The synthesis of the 4-hydroxybenzoate esters involved refluxing 4hydroxybenzoic acid with the appropriate alcohol (in slight excess) and a few drops of concentrated sulfuric acid as a catalyst. The reaction was refluxed for 6 h , and the work up involved addition of 2 M NaOH , to neutralise the acidic mixture. In general, the reactions proceeded in good to poor yields ranging from 46\% (for compound 228) to 11\% (for compound 234) - the percentage yield appeared to decrease within increasing alkyl chain length. With the dibrominated esters, the reactions again proceeded in excellent to extremely poor yield ranging from $82 \%$ (for compound 243 ) to $4 \%$ (for compound 255), however, unlike the non-brominated esters, no clear trend is visible. Finally, with the mono-brominated esters, the reactions again proceeded in good to poor yield ranging from $57 \%$ (for compound 259) to $12 \%$ (for compound 264) - in general, an overall decrease in yield is observed with increasing alkyl chain length.

A problem was, however, encountered with the removal of the excess alcohol since the longer alkyl chain containing alcohols were found to possess high boiling points and therefore could not be easily distilled. This resulted in low yielding reactions, for example the $4 \%$ yield obtained for compound 255, was mainly due to the attempts made to purify the compound. The higher yielding products, e.g. compound 243 , were obtained without the use of column chromatography.

The 4-hydroxybenzoate esters were then aminosulfonated using the method previously discussed for the synthesis of the sulfamated derivatives of 4hydroxy ketones. That is, the various esters of 4-hydroxybenzoic acid were stirred in the presence of freshly prepared aminosulfonyl chloride solution using DMA as the solvent (Chapter 2; Scheme 2.2). However, in the synthesis of the compounds based on 4-hydroxybenzoic acid, it was found that the aminosulfonated products were difficult to isolate due mainly to the lack of stability of the product. Indeed we discovered that the products underwent rapid hydrolysis to give back the 4-hydroxybenzoic acid ester and the aminosulfonated derivative. This proved to be a major problem since any column chromatography was found to enhance hydrolysis. Furthermore, it
was discovered that the compounds could not be stored, even at $0^{\circ} \mathrm{C}$. The instability of the products made it impossible to isolate any product, let alone for spectral analysis. In a study by Cartledge (2004), it was discovered that the brominated derivatives did indeed stabilise the phenoxide ion. That is, the $\mathrm{p} K_{\mathrm{a}}$ values for a range of substituted and non-substituted derivatives of esters of 4-hydroxy benzoic acid were studied using a UV spectroscopic technique. Cartledge discovered that the mono- and di-brominated compounds were highly acidic in nature when compared to the non-brominated derivatives. James (2000) had previously reported that phenolic based inhibitors containing electron withdrawing groups undergo self-hydrolysis. As such, we propose that the mono- and di-brominated derivatives undergo self-hydrolysis, and therefore, the reaction scheme was abandoned for the bromo derivatives. The sulfamated derivatives of 4-hydroxybenzoic acid also proved to be a problem and only three compounds are reported. It was found that compounds with alkyl chain greater than pentyl underwent hydrolysis whilst the compounds were being purified using column chromatography (the remaining compounds were observed on thin layer chromatography but no GC-MS analysis were undertaken on the sulfamate derivatives due to the instability of the sulfamate group).

### 4.2 Synthesis of toluene-4-sulfonic acid pyridin-3-yl-ester

The $p$-toluene sulfonation of 3 -hydroxypyridine using $p$-toluene sulfonyl chloride was also attempted (Scheme 4.2).

TEAJDCM

238

Scheme 4.2: Para-toluene sulfonation of 3-hydroxypyridine

This method was carried out by refluxing a stirring solution the reactants in DCM and TEA for 3 h . Compound $\mathbf{2 3 8}$ was obtained in a satisfactory yield (66\%).

### 4.3 Methane sulfonation of the 4-hydroxy derivatives of phenyl azole and pyridine

Methane sulfonations of 4-hydroxyphenyl azole (Scheme 4.5) and the 3substituted and 4 -substituted hydroxypyridines were also carried out (Schemes 4.3 and 4.4).

239
Scheme 4.3: Methanesulfonation of 3-hydroxypyridine

In the case of 3-hydroxy pyridine, this reaction was straight-forward. The two starting materials were commercially available and the reaction was left to reflux overnight, in triethylamine (TEA) and dichloromethane (DCM), as the solvents. An excellent yield for compound 239 was obtained (83\%).

240

Scheme 4.4: Methanesulfonation of 4-hydroxypyridine

For the reaction with 4-hydroxypyridine, as shown in Scheme 4.4, the starting materials were once again commercially available but this time the reaction
was refluxed for 3 h , in TEA and DCM and compound $\mathbf{2 4 0}$ was obtained with a yield of $63 \%$

Scheme 4.5: Methanesulfonation of 4-hydroxyphenyltriazole

In the case of 4-hydroxyphenyl triazole, as shown in Scheme 4.5, the starting materials were commercially available and refluxed for 3 h . This compound however, was difficult to work up, as it was forming a sticky residue in the flask. The yield obtained for compound 241 was $49 \%$.

Scheme 4.6: Methanesulfonation of 4-hydroxyphenylimidazole

For the reaction shown in Scheme 4.6, the starting materials were also refluxed for 3 h and in this case, the work up was slightly easier compared to the compounds shown in the schemes above. Compound $\mathbf{2 4 2}$ was obtained in an excellent yield of $74 \%$.

In general, the problems encountered with these compounds was the fact that they were found to be problematic as to establish a satisfactory thin-layer chromatography system (TLC) and so the purity and analysis depended on the other available analytical techniques such as NMR and IR.

### 4.4 Synthesis of the 4-hydroxybenzoic acid alkyl esters

## 4-Hydroxy-benzoic acid methyl ester (228)

4-Hydroxy-benzoic acid $(2.22 \mathrm{~g}, 0.016 \mathrm{~mol})$, methanol $(10 \mathrm{~mL})$ and concentrated sulfuric acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)(1 \mathrm{~mL})$ were dissolved in toluene $(20 \mathrm{~mL})$, and the mixture was refluxed for 6 h . After cooling to room temperature, the mixture was neutralised with 2 M NaOH and the resulting mixture was allowed to stand for 15 min , before being poured into a solution of ice/water. A precipitate was observed, which was collected and dried to give 228 as a white solid (1.12g, $45.71 \%$ yield) [m.p. $136.4-137.5^{\circ} \mathrm{C}$ ); $R_{f} 0.43$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit.m.p. $131-132^{\circ} \mathrm{C}$ (Inouye, H. et al, 1979)].
$v_{(\text {max })}($ Film $) \mathrm{cm}^{-1}: 3263.6(\mathrm{OH}), 2360.8(\mathrm{CH}), 1688.2(\mathrm{C}=\mathrm{O}), 1609.6,1586.3$, 1438.6 ( $\mathrm{Ar} \mathrm{C}=\mathrm{C}$ ), $1316.8(\mathrm{C}-\mathrm{H}), 1282.7(\mathrm{C}-\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 8.01(2 \mathrm{H}$, d, $\mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.25(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.9(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.85(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), \delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 166.30(\underline{\mathrm{C}}=\mathrm{O}), 160.00$ (Ph- $\left.\underline{\mathrm{C}}-\mathrm{O}\right), 132.00,122.00,115.20$ (Ar-르), $50.50\left(\mathrm{OCH}_{3}\right) ;$ GC: $\mathrm{t}_{\mathrm{R}} 6.46 \mathrm{~min} ;$ LRMS (EI): $152\left(M^{+}, 41 \%\right), 121\left(M^{+}-\right.$ $\mathrm{OCH}_{3}, 100 \%$ ).

## 4-Hydroxy-benzoic acid ethyl ester (229)

Compound 229 was synthesised in the same way as 228 except 4-hydroxybenzoic acid $(2.11 \mathrm{~g}, 0.015 \mathrm{~mol})$ and ethanol $(10 \mathrm{~mL})$ was used instead of methanol. The precipitate was collected and dried to give 229 as a white solid ( $0.88 \mathrm{~g}, 34.65 \%$ yield) [m.p. $117.2-117.7^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.23$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $117-118^{\circ} \mathrm{C}$ (Gutkowska and Biniecki, 1962)].
$v_{(\text {max })}$ (Film) $\mathrm{cm}^{-1}: 3221.20(\mathrm{OH}), 2927.90(\mathrm{CH}), 1674.80(\mathrm{C}=\mathrm{O}), 1609.60$, 1591.50, 1449.70, 1371.50 ( $\mathrm{ArC=C}$ ), $1287.70(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 7.96(2 \mathrm{H}, \mathrm{d}$, $\mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.25(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.85(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.34(2 \mathrm{H}, \mathrm{q}$, $\left.\mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 1.37\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 167.00(\underline{\mathrm{C}}=\mathrm{O})$, 160.00 (Ar- $\underline{C}-\mathrm{O}), 131.87,115.12(\mathrm{Ar}-\underline{\mathrm{C}}), 60.78\left(\mathrm{OCH}_{2}\right), 14.34\left(\underline{\mathrm{C}} \mathrm{H}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}}$ $6.95 \mathrm{~min} ;$ LRMS (EI): $166\left(M^{+}, 25 \%\right), 121\left(M^{+}-\mathrm{OC}_{2} \mathrm{H}_{5}, 100 \%\right)$.

## 4-Hydroxy-benzoic acid propyl ester (230)

4 -Hydroxy-benzoic acid $(2.07 \mathrm{~g}, 0.015 \mathrm{~mol})$, propan- 1 -ol $(10 \mathrm{~mL})$ and concentrated sulfuric acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)(1 \mathrm{~mL})$ were dissolved in toluene $(20 \mathrm{~mL})$, and the mixture was refluxed for 6 h . After cooling to room temperature, the mixture was neutralised with 2 M NaOH and the resulting mixture was allowed to stand for 15 min , before being poured into a solution of ice/water and then
extracted into DCM ( 25 mL ). The organic phase was dried over anhydrous $\mathrm{MgSO}_{4}$ and the mixture was filtered and removal of the solvent in vacuo gave 230 as a white solid ( $0.46 \mathrm{~g}, 17.04 \%$ yield) [m.p. 109.2-109.9 ${ }^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.47$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; Lit. m.p. $95-97^{\circ} \mathrm{C}$ (Blaug and Ahsan, 1961)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3269.60(\mathrm{OH}), 2980.20(\mathrm{CH}), 1677.00(\mathrm{C}=\mathrm{O}), 1606.70$, 1588.20, 1439.90 ( $\mathrm{ArC=C}$ ); $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 7.94(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.30$ $(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 6.89(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.26\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH} \underline{H}_{2}\right)$, 1.75-1.79 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $1.02\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right), \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 167.46$ ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 160.61 (Ar- $\underline{-}-\mathrm{O}), 131.90,122.15,115.31$ (Ar- $\underline{-}), 66.68\left(\mathrm{OCH}_{2}\right), 22.04$ $\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 10.47\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 7.64 \mathrm{~min} ; 180\left(M^{+}, 13 \%\right), 121\left(M^{+}-\mathrm{OC}_{3} \mathrm{H}_{7}\right.$, 100\%).

## 4-Hydroxy-benzoic acid butyl ester (231)

Compound 231 was synthesised in the same way as 230 except 4 -hydroxybenzoic acid $(2.02 \mathrm{~g}, 0.015 \mathrm{~mol})$, and butanol ( 10 mL ) was used instead of propan-1-ol. Removed of the solvent in vacuo gave 231 as a white solid ( $0.43 \mathrm{~g}, 15.14 \%$ yield) [m.p. $80.2-81.9^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.51$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $73^{\circ} \mathrm{C}$ (Blaug and Ahsan, 1961)].
$v_{(\text {max) }}$ (Film) $\mathrm{cm}^{-1}: 3356.50(\mathrm{OH}), 2960.30(\mathrm{CH}), 1683.70,1608.60(\mathrm{ArC=C})$, $1444.70(\mathrm{CH}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 7.95(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.26(2 \mathrm{H}, \mathrm{d}$, $J=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.88(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.28\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH} \underline{H}_{2}\right), 1.62-1.81$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $1.30-1.58\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.96(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}$, $\mathrm{CH}_{3}$ ); $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right.$ ): 167.26 ( $\mathrm{C}=\mathrm{O}$ ), 160.40 (Ar- $\underline{\mathrm{C}}-\mathrm{O}$ ), 131.89, 122.38, 115.27 (Ar-

C- $) 64.92\left(\mathrm{O}_{2}\right), 30.72\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 19.24\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 13.73\left(\mathrm{C}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}}$ $8.32 \mathrm{~min} ;$ LRMS (EI): 194 ( $\left.M^{+}, 11 \%\right), 138\left(M^{+}-\mathrm{C}_{4} \mathrm{H}_{8}, 100 \%\right)$.

4-Hydroxy-benzoic acid pentyl ester (232)

Compound 232 was synthesised in the same way as $\mathbf{2 3 0}$ except 4-hydroxybenzoic acid $(2.01 \mathrm{~g}, 0.015 \mathrm{~mol})$, and pentanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave 232 as a white solid ( $0.52 \mathrm{~g}, 17.16 \%$ yield) [m.p. $53.4-55.1^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.56$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $54^{\circ} \mathrm{C}$ (De Leon et al, 1964)].
$v_{(\text {max) })}($ Film $) \mathrm{cm}^{-1}: 3344.30(\mathrm{OH}), 2958.20(\mathrm{CH}), 1683.80(\mathrm{C}=\mathrm{O}), 1592.00$, 1514.60, 1445.00 ( $\mathrm{ArC=C}$ ); $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 7.94(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.26$ $(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.88(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.27\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OC} \underline{H}_{2}\right)$, 1.60-1.91 (2H, m, CH2 $)_{2}$, 1.21-1.52 [4H, m, $\left.\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 0.91(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}$, $\mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 167.23$ ( $\mathrm{C}=\mathrm{O}$ ), 160.39 ( $\mathrm{Ar}-\underline{-}-\mathrm{O}$ ), 131.89, 122.41, 115.27 ( Ar C $)$, $65.20\left(\mathrm{OCH}_{2}\right), 28.38\left(\mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 28.16\left[\mathrm{O}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\right], 22.33\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $13.96\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 8.97 \mathrm{~min} ; \operatorname{LRMS}(\mathrm{EI}): 208\left(M^{+}, 8 \%\right), 138\left(M^{+}-\mathrm{C}_{5} \mathrm{H}_{10}\right.$, 100\%).

## 4-Hydroxy-benzoic acid heptyl ester (233)

Compound $\mathbf{2 3 3}$ was synthesised in the same way as $\mathbf{2 3 0}$ except 4 -hydroxybenzoic acid $(2.05 \mathrm{~g}, 0.015 \mathrm{~mol})$, and heptanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave 233 as a pale yellow solid ( $0.47 \mathrm{~g}, 13.39 \%$ yield) [m.p. $56.8-57.3^{\circ}{ }^{\circ} ; R_{f} 0.33$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit.m.p. $55.6-57.9^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3344.20(\mathrm{OH}), 2929.60(\mathrm{CH}), 1683.60(\mathrm{C}=\mathrm{O}), 1591.90$, 1514.80, 1445.30, $1312.10(\mathrm{ArC=C}) ; ~ \delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.94(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-$ H), $6.89(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.69(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.29(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}$, $\left.\mathrm{OCH}_{2}\right), 1.61-1.92\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 1.61-1.92\left[8 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 0.88(3 \mathrm{H}$, $\left.\mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 167.15 \quad(\underline{\mathrm{C}}=\mathrm{O}), 160.30 \quad(\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}), 131.88$, 122.49, 115.25 (Ar- $\underline{\mathrm{C}}), 65.19\left(\mathrm{OCH}_{2}\right), 31.70\left(\mathrm{OCH}_{2} \underline{\mathrm{CH}}_{2}\right), 28.92\left[\left(\mathrm{CH}_{2}\right)_{2}\right], 28.69$ $\left(\underline{\mathrm{C}_{2}}\right), 25.97\left(\underline{\mathrm{C}}_{2}\right), 22.56\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 14.04\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 10.11 \mathrm{~min} ;$ LRMS (EI): $236\left(M^{+}, 5 \%\right), 138\left(M^{+}-\mathrm{C}_{7} \mathrm{H}_{14}, 100 \%\right)$.

4-Hydroxy-benzoic acid octyl ester (234)

Compound 234 was synthesised in the same way as $\mathbf{2 3 0}$ except 4 -hydroxybenzoic acid $(2.00 \mathrm{~g}, 0.014 \mathrm{~mol})$, and octanol $(10 \mathrm{~mL})$ was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave 234
as a yellow solid $\left(0.38 \mathrm{~g}, 10.50 \%\right.$ yield) [m.p. $58.9-59.4^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.29$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $51.0-51.6^{\circ} \mathrm{C}$ (Olivier, 1937)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3346.30(\mathrm{OH}), 2927.80(\mathrm{CH}), 1683.40(\mathrm{C}=\mathrm{O}), 1608.80$, 1591.70, $1514.80,1445.00(\mathrm{ArC=C}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 7.95(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-$ $\underline{H}), 6.89(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.64(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.29(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}$, $\left.\mathrm{OCH}_{2}\right), 1.62-1.91\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 1.13-1.49\left[10 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{3}\right], 0.87$ $\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 167.14$ ( $\mathrm{C}=\mathrm{O}$ ), 160.27 ( $\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}$ ), 131.89, 122.52, 115.25 (Ar-C $), \quad 65.19 \quad\left(\mathrm{OCH}_{2}\right), \quad 31.77 \quad\left(\mathrm{OCH}_{2} \mathrm{CH}_{2}\right), \quad 29.22$ $\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 29.17\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 28.69\left(\mathrm{CH}_{2}\right), 26.02\left(\mathrm{CH}_{2}\right), 22.62$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 14.07\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 10.70 \mathrm{~min} ;$ LRMS (EI): $250\left(M^{+}, 6 \%\right), 138\left(M^{+}-\right.$ $\mathrm{C}_{8} \mathrm{H}_{16}, 100 \%$ ).

### 4.5 Synthesis of the sulfamic acid 4-alkylphenyl esters

## 4-Sulfamoyloxy-benzoic acid methyl ester (235)

A solution of 190 in toluene ( $20 \mathrm{~mL}, \sim 230 \mathrm{mmol}$ ) was added to a stirred mixture of $228(0.62 \mathrm{~g}, 4.08 \mathrm{mmol})$ in DMA $(0.6 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ for 3 h , after which, it was poured into saturated brine solution ( $2 \times 50 \mathrm{~mL}$ ) and extracted into ethyl acetate $(2 \times 25 \mathrm{~mL})$. The organic phase was washed with brine $(2 \times 25 \mathrm{~mL})$ and dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered, and removal of the solvent in vacuo gave a crude solid. Flash column chromatography of the crude solid gave 235 as a white solid $(0.21 \mathrm{~g}, 22.34 \%$ yield) [m.p. $177.6-$ $178.7^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.10$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit.m.p. 118 $121^{\circ} \mathrm{C}$ (Patel et al, 2004)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3424.10\left(\mathrm{NH}_{2}\right), 3204.10,3424.10\left(\mathrm{NH}_{2}\right), 2810.00(\mathrm{CH})$, 1673.80 ( $\mathrm{C}=\mathrm{O}$ ), 1603.30, 1506.90, 1433.50 ( $\mathrm{ArC=C}$ ), 1389.10, 1287.70 $(\mathrm{S}=\mathrm{O}) ; \delta_{H}\left(d_{6}\right.$-Acetone): $8.06(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}) ; 7.27(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}$, Ph-H), $7.25\left(2 \mathrm{H}, \mathrm{s}, \mathrm{NH}_{2}\right), 3.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}}\left(d_{6}\right.$-Acetone): 166.90 ( $\mathrm{C}=\mathrm{O}$ ), 156.01 (Ar-C-O), 131.44, 127.60, 122.55 (Ar-C), $52.1\left(\mathrm{OCH}_{3}\right)$.

4-Sulfamoyloxy-benzoic acid ethyl ester (236)

Compound 236 was synthesised in the same way as 235 except 229 ( 0.60 g , $3.61 \mathrm{mmol})$ in DMA $(0.6 \mathrm{~mL})$ was used. Removal of the solvent in vacuo gave a crude solid. Flash column chromatography of the crude solid gave $\mathbf{2 3 6}$ as a white solid ( $0.21 \mathrm{~g}, 23.60 \%$ yield) [m.p. $98.6-99.3^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.13$ diethyl ether/petroleum ether ( $40: 60$ ); lit. m.p. $83-86^{\circ} \mathrm{C}$ (Owen et al, 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3318.70,3100.00\left(\mathrm{NH}_{2}\right), 2985.00(\mathrm{CH}), 1701.80(\mathrm{C}=\mathrm{O})$, 1601.80, 1501.20, 1453.30 ( $\mathrm{ArC=C}$ ), 1369.90, $1282.60(\mathrm{~S}=\mathrm{O}) ; \delta_{H}\left(d_{6}\right.$ Acetone): $8.07(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.45(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.25$ $\left(2 \mathrm{H}, \mathrm{s}, \mathrm{NH}_{2}\right), 4.30-4.38\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.32-1.37\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{c}}\left(d_{6}-\right.$ Acetone): 166.00 ( $\mathbf{C}=\mathbf{O}$ ), 132.10 (Ar-C-O), 131.90, 130.00, 123.04 (Ar-C), $61.90\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 14.44\left(\mathrm{C}_{3}\right)$.

## 4-Sulfamoyloxy-benzoic acid propyl ester (237)

Compound 237 was synthesised in the same way as 235 except 230 ( 0.56 g , $2.89 \mathrm{mmol})$ in DMA ( 0.6 mL ) was used. Removal of the solvent in vacuo gave a crude solid. Flash column chromatography of the crude solid gave 237 as a white solid ( $0.10 \mathrm{~g}, 12.66 \%$ yield) [m.p. $99.7-101.9^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.15$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $58-60^{\circ} \mathrm{C}$ (Owen et al, 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3430.10,3347,10\left(\mathrm{NH}_{2}\right.$ stretch), 2969.90 (CH aliphatic stretch), 1715.70 ( $\mathrm{C}=0$ ), 1601.90, 1501.90, 1463.40 (Ar), 1388.10, 1277.60 $(\mathrm{S}=\mathrm{O}), 1217.50(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.02(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.43(2 \mathrm{H}, \mathrm{d}$, $\mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.25\left(2 \mathrm{H}, \mathrm{s}, \mathrm{NH}_{2}\right), 4.25\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2}\right), 2.03-2.05$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.01\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \underline{\mathrm{C}} \mathrm{H}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 166.00(\underline{\mathrm{C}}=\mathrm{O})$, 155.10 (Ar-C-O), 132.00, 131.38, 129.90 (Ar-C), $67.00\left(\mathrm{OCH}_{2}\right), 22.50$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 11.02\left(\mathrm{CH}_{3}\right)$.

### 4.6 Synthesis of toluene-4-sulfonic acid pyridin-3-yl-ester

Toluene-4-sulfonic acid pyridin-3-yl-ester (238)

p-toluene sulfonyl chloride ( $2.4 \mathrm{~g}, 13 \mathrm{mmol}$ ) was added dropwise to a stirred solution of 3 -hydroxypyridine ( $1 \mathrm{~g}, 105 \mathrm{mmol}$ ) in TEA ( $1.63 \mathrm{~mL}, 169 \mathrm{mmol}$ ), and anhydrous DCM $(50 \mathrm{~mL})$ at room temperature and refluxed for 3 h . After cooling down to room temperature, it was quenched in ice, washed with $\mathrm{H}_{2} \mathrm{O}$ ( $3 \times 20 \mathrm{~mL}$ ) and cold saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}(3 \times 20 \mathrm{~mL})$. The organic phase was washed again with $\mathrm{H}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$ and then dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered and the solvent was removed in vacuo to give a crude solid. Flash column chromatography of the crude solid gave 238 as a shiny white crystalline solid ( $1.82 \mathrm{~g}, 66 \%$ yield) [m.p. $98.7-99.3^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.11$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $80^{\circ} \mathrm{C}$ (Cavallito and Haskell, 1944)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3430.10,3347.10(\mathrm{NH}), 2969.90(\mathrm{CH}), 1715.70(\mathrm{C}=\mathrm{O})$, 1601.90, 1501.90, 1463.40 ( $\operatorname{ArC=C}$ ), 1388.10, $1277.60(\mathrm{~S}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(d_{\sigma^{-}}\right.$ Acetone): 8.51 ( $2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ar}-\underline{\mathrm{H}}), 8.22(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ar}-\underline{\mathrm{H}}), 7.75$ $(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.50(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 2.46\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ;$ $\delta_{\mathrm{C}}\left(d_{\sigma}\right.$-Acetone): 149.21, 147.43, 147.20 (Ar-C), 132.67, 131.06, 130.69, 129.32 (Ar-C), 125.32, 20.91; GC: $\mathrm{t}_{\mathrm{R}} 10.14 \mathrm{~min}$; LRMS (EI): 249 ( $M^{+}, 5 \%$ ), 91 ( $M^{+}-\mathrm{SO}_{3} \mathrm{C}_{5} \mathrm{H}_{4} \mathrm{~N}, 100 \%$ ).

### 4.7 Synthesis of the methanesulfonic acid pyridin- $N$-yl esters

## Methanesulfonic acid pyridin-3-yl ester (239)

Compound 239 was synthesized in the same way as 238 , except methane sulfonyl chloride ( $0.98 \mathrm{~mL}, 128 \mathrm{mmol}$ ), 3 -hydroxypyridine ( $1.04 \mathrm{~g}, 106 \mathrm{mmol}$ ) and TEA ( $1.94 \mathrm{~mL}, 117 \mathrm{mmol}$ ) were used. The mixture was filtered and removal of the solvent in vacuo gave $\mathbf{2 3 9}$ as long crystalline white crystals $\left(1.54 \mathrm{~g}, 83 \%\right.$ yield) [m.p. $69.7-72.9^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{t}} 0.39$ ether ( $100 \%$ ); lit. m.p. $59-60^{\circ} \mathrm{C}$ (Lyle and Boyle, 1974)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3030.00(\mathrm{C}-\mathrm{N}), 2922.10(\mathrm{CH}), 1597.90(\mathrm{C}=\mathrm{C}), 1573.90$ (C=N), 1479.70 (CH), 1428.30 (CH), 1377.40 (CH), 1201.60 (C-N), 1366.50, $1164.30(\mathrm{~S}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.59(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{CH}), 7.70(1 \mathrm{H}, \mathrm{d}$, $J=8.00 \mathrm{~Hz}, \mathrm{CH}), 7.35-7.44(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}), 3.19\left(3 \mathrm{H}, \mathrm{s}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ;$ $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 148.05$ (ㄷ-O), 143.21 (다), 130.28 (ㄷH), 124.63 (CH), 37.85 $\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 5.98 \mathrm{~min} ;$ LRMS (EI): $173\left(M^{+}, 22 \%\right), 95\left(M^{+}-\mathrm{SO}_{2} \mathrm{CH}_{2}, 100 \%\right)$.

Methanesulfonic acid pyridin-4-yl ester (240)

Compound 240 was synthesised in the same way as 238 except methane sulfonyl chloride ( $0.98 \mathrm{~mL}, 128 \mathrm{mmol}$ ), 4 -hydroxypyridine ( $1.04 \mathrm{~g}, 106 \mathrm{mmol}$ ) and TEA ( $1.94 \mathrm{~mL}, 117 \mathrm{mmol}$ ) were used. The mixture was filtered and
removal of the solvent in vacuo gave 240 as a dark orange solid $(1.20 \mathrm{~g}, 63 \%$ yield) [m.p. $161.1-161.6^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.10$ ether (100\%)].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 3410.30(\mathrm{CH}), 2360.80(\mathrm{CH}), 1622.70(\mathrm{C}=\mathrm{C}), 1498.50(\mathrm{CH})$, $1254.20(\mathrm{C}-\mathrm{O}), 1197.00(\mathrm{~S}=\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 9.05(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.04$ $(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}), 4.80\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 144.15\left(\underline{\mathrm{C}}-\mathrm{O}-\mathrm{SO}_{2} \mathrm{CH}_{3}\right), 141.81$ (ㄷ-$\mathrm{N}-\mathrm{CH}), 120.72(\mathrm{Ar} \underline{\mathrm{C}}), 37.8\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 6.06 \mathrm{~min} ;$ LRMS (EI): $173\left(\mathrm{M}^{+}, 90 \%\right)$, $95\left(M^{+}-\mathrm{SO}_{2} \mathrm{CH}_{2}, 100 \%\right)$.

## Methanesulfonic acid 4-[1,2,4]-triazol-1-yl-phenyl ester (241)

Compound 241 was synthesised in the same way as 238 except methane sulfonyl chloride $(0.58 \mathrm{~mL}, 128 \mathrm{mmol})$, 4-hydroxy phenyl triazole $(1.01 \mathrm{~g}$, $106 \mathrm{mmol})$ and TEA ( $1.14 \mathrm{~mL}, 117 \mathrm{mmol}$ ) were used. The mixture was filtered and removal of the solvent in vacuo gave 241 as an off-white solid $(0.74 \mathrm{~g}$, $49 \%$ yield) [m.p. $172.3-173.3^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.17$ chloroform (100\%)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3410.00(\mathrm{CH}), 2360.90(\mathrm{CH}), 1517.60(\mathrm{C}=\mathrm{N}), 1359.50(\mathrm{CH})$, $1277.50(\mathrm{C}-\mathrm{O}), 1180.30(\mathrm{~S}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(d_{6}\right.$-methanol): $9.35(1 \mathrm{H}, \mathrm{s}, \operatorname{Ar}-\underline{\mathrm{H}}), 8.28(2 \mathrm{H}$, $\mathrm{s}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.98(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.48-7.67(2 \mathrm{H}, \mathrm{m}, \mathrm{Ph}-\underline{\mathrm{H}}), 3.49(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(d_{6}\right.$-methanol): 154.61 ( $\underline{\mathrm{CH}}$ ), $144.65(\underline{\mathrm{C}}-\mathrm{N}), 137.10,125.78$ (드) , $123.13(\mathrm{Ar}), 38.8\left(\mathrm{CH}_{3}\right) ; G C: \mathrm{t}_{\mathrm{R}} 10.55 \mathrm{~min} ; \operatorname{LRMS}(\mathrm{El}): 239\left(M^{+}, 57 \%\right), 160$ ( $M^{+}-\mathrm{SO}_{2} \mathrm{CH}_{3}, 100 \%$ ).

## Methanesulfonic acid 4-imidazol-1-yl-phenyl ester (242)

Compound 242 was synthesised in the same way as $\mathbf{2 3 8}$ except methane sulfonyl chloride ( $0.58 \mathrm{~mL}, 128 \mathrm{mmol}$ ), 4-hydroxyphenyl imidazole $(1.00 \mathrm{~g}$, 106 mmol ) and TEA ( $1.15 \mathrm{~mL}, 117 \mathrm{mmol}$ ) were used. The mixture was filtered and removal of the solvent in vacuo gave 242 as an off-white solid (1.11g, $74.39 \%$ yield) [m.p. $97.4-98.6^{\circ} \mathrm{C} ; \mathrm{R}_{f} 0.75$ methanol ( $100 \%$ )].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3396.30(\mathrm{C}-\mathrm{N}), 1515.30,1364.00,1156.40(\mathrm{~S}=\mathrm{O}), 1304.80$ $(\mathrm{CH}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.25(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}$, imidazole), $7.76(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{CH})$, $7.61\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}\right.$-imidazole), $7.53(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 3.31\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$; $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : 149.15 ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), 136.34 ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), 130.06 ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), 124.65, 123.44, 119.25 (Ar-C), $37.0\left(\underline{\mathrm{CH}_{3}}\right)$; GC: $\mathrm{t}_{\mathrm{R}} 11.05 \mathrm{~min} ;$ LRMS (EI): 238 ( $M^{+}, 97 \%$ ), 159 ( $M^{+}-\mathrm{SO}_{2} \mathrm{CH}_{3}, 100 \%$ ).

### 4.8 Synthesis of derivatives of 3,5-dibromo-4-hydroxy-benzoic acid alkyl/cycloalkyl esters

## 3,5-Dibromo-4-hydroxy-benzoic acid methyl ester (243)

3,5-Dibromo-4-hydroxy-benzoic acid ( $1.02 \mathrm{~g}, 3.45 \mathrm{mmol}$ ), methanol ( 10 mL ) and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ ( 1 mL ) were dissolved in toluene $(25 \mathrm{~mL}$ ), and the mixture
was refluxed for 6 h . After cooling to room temperature, it was neutralised with 2 M NaOH , and the resulting mixture was allowed to stand for 15 min , before being poured into a solution of ice/water. A precipitate had formed, which was then filtered and dried to give $\mathbf{2 4 3}$ as a white solid ( $0.88 \mathrm{~g}, 82.24 \%$ yield) [m.p. $124.2-125.8^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.45$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. 104.3-106.0 ${ }^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3420.00(\mathrm{OH}), 1693.60(\mathrm{C}=\mathrm{O}), 15300,1431.50(\mathrm{ArC}=\mathrm{C})$, $1272.50(\mathrm{C}-\mathrm{O}) ; ~ \delta_{\mathrm{H}}\left(d_{6}\right.$-Methanol): $8.00(2 \mathrm{H}, \mathrm{s}, \mathrm{Ph}-\underline{\mathrm{H}}), 4.96\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$; $\delta_{\mathrm{c}}\left(d_{6}\right.$-Methanol): 164.40 ( $\mathrm{C}=\mathrm{O}$ ), 155.10 ( $\mathrm{Ar}-\mathrm{C}-\mathrm{O}$ ), 133.10, 123.05, 110.90 (ArC), $51.72\left(\mathrm{OCH}_{3}\right)$; GC: $\mathrm{t}_{\mathrm{R}} 8.95 \mathrm{~min} ;$ LRMS (EI): $310\left(M^{+}, 45 \%\right), 279\left(M^{+}-\mathrm{OCH}_{3}\right.$, 100\%).

## 3,5-Dibromo-4-hydroxy-benzoic acid ethyl ester (244)

Compound 244 was synthesised in the same way as compound 243, except that 3,5 -dibromo-4-hydroxy-benzoic acid $(1.00 \mathrm{~g}, 3.39 \mathrm{mmol})$, and ethanol $(10 \mathrm{~mL})$ was used instead of methanol. The precipitate was filtered and dried to give 244 as a white solid $\left(0.59 \mathrm{~g}, 54.13 \%\right.$ yield) [m.p. $101.7-102.3^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}$ 0.53 diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $104.1-105.6^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3343.90(\mathrm{OH}), 2990.10(\mathrm{CH}), 1700.90(\mathrm{C}=\mathrm{O}), 1588.00$, 1553.20, 1472.10, $1469.70(\mathrm{ArC=C}), 1299.30(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.14(2 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\underline{\mathrm{H}}), 6.29(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.36\left(2 \mathrm{H}, \mathrm{q}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 1.38(3 \mathrm{H}$, $\mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}$ ); $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right.$ ): 164.08 ( $\mathrm{C}=\mathrm{O}$ ), 153.05 (Ar- $-\mathrm{C}-\mathrm{O}$ ), 133.57, 125.10,

## 3,5-Dibromo-4-hydroxy-benzoic acid propyl ester (245)

3,5-Dibromo-4-hydroxy-benzoic acid ( $1.00 \mathrm{~g}, 3.38 \mathrm{mmol}$ ), propan-1-ol ( 10 mL ) and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(1 \mathrm{~mL})$ were dissolved in toluene $(25 \mathrm{~mL})$, and the mixture was refluxed for 6 h . After cooling to room temperature, the mixture was neutralised with 2 M NaOH and the resulting mixture was allowed to stand for 15 min , before being poured into a solution of ice/water and then extracted into DCM ( 25 mL ). The organic phase was dried over anhydrous $\mathrm{MgSO}_{4}$. The mixture was filtered and removal of the solvent in vacuo gave $\mathbf{2 4 5}$ as a white solid ( $0.61 \mathrm{~g}, 53.51 \%$ yield) [m.p. $109.8-110.5^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.51$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $107.2-108.8^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3306.00(\mathrm{OH}), 2966.40(\mathrm{CH}), 1699.00(\mathrm{C}=\mathrm{O}), 1588.00$, 1554.40, 1480.30, 1395.70 ( $\mathrm{ArC=C}$ ), $1299.30(\mathrm{C}-\mathrm{O}) ; ~ \delta_{H}\left(\mathrm{CDCl}_{3}\right): 8.14(2 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\underline{\mathrm{H}}), 6.25(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.24\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH} \underline{H}_{2}\right), 1.77(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.01\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 164.01(\underline{\mathrm{C}}=\mathrm{O}), 153.03$ (Ar-C-O), 133.56, 125.10, 109.63 (Ar- $\underline{C}$ ), $67.10\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.03\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $10.47\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 9.91 \mathrm{~min} ;$ LRMS (EI): $338\left(M^{+}, 16 \%\right), 296\left(M^{+}-\mathrm{C}_{3} \mathrm{H}_{6}\right.$, 100\%).

## 3,5-Dibromo-4-hydroxy-benzoic acid butyl ester (246)

Compound 246 was synthesised in the same way as compound 245, except that 3,5 -dibromo-4-hydroxy-benzoic acid $(0.98 \mathrm{~g}, 3.31 \mathrm{mmol}$ ), and butanol $(10 \mathrm{~mL})$ was used instead of propan-1-ol. Removal of the solvent in vacuo gave 246 as a white solid ( $0.87 \mathrm{~g}, 74.36 \%$ yield) [m.p. $89.1-91.5^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.69$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $90.2-91.0^{\circ} \mathrm{C}$ (Patel, M., 2003)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3309.60(\mathrm{OH}), 2958.10(\mathrm{CH}), 1701.40(\mathrm{C}=\mathrm{O}), 1588.80$, 1555.90, 1480.60, $1393.50(\mathrm{ArC=C}), 1299.20(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) ; 8.13(2 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\underline{\mathrm{H}}), 6.27(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.28\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2}\right), 1.65-1.80(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.38-1.51\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.97\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ;$ $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 164.04(\underline{\mathrm{C}}=\mathrm{O}), 153.03$ (Ar- $\left.\underline{\mathrm{C}}-\mathrm{O}\right), 133.55,125.11,109.63$ ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), $65.42\left(\mathrm{OCH}_{2}\right), 30.68\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 19.19\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 13.72\left(\mathrm{C}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{R}$ $10.48 \mathrm{~min} ;$ LRMS (EI): $352\left(M^{+}, 9 \%\right), 296\left(M^{+}-\mathrm{C}_{4} \mathrm{H}_{8}, 100 \%\right)$.

## 3,5-Dibromo-4-hydroxy-benzoic acid pentyl ester (247)

Compound 247 was synthesised in the same way as compound 245, except that 3,5 -dibromo-4-hydroxy-benzoic acid ( $1.01 \mathrm{~g}, 3.41 \mathrm{mmol}$ ), and pentanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave a crude oil. Flash column chromatography of the crude oil gave 247 as a pale yellow solid $(0.82 \mathrm{~g}, 65.60 \%$ yield) [m.p. 61.4$62.1^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.57$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(20: 80)$ ].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3377.40(\mathrm{OH}), 2957.90(\mathrm{CH}), 1704.40(\mathrm{C}=\mathrm{O}), 1587.90$, 1572.10, 1468.00, $1400.30(\mathrm{ArC=C}), 1295.90(\mathrm{C}-\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right) ; 8.13(2 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\underline{\mathrm{H}}), 6.30(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.27\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OC} \mathrm{H}_{2}\right), 1.72-180[2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 1.22-1.54\left[4 \mathrm{H}, \mathrm{m}_{1}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 0.92\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right)$; $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right)$ : $164.04(\underline{\mathrm{C}}=\mathrm{O}), 153.03$ (Ar- $\left.\underline{\mathrm{C}}-\mathrm{O}\right), 133.56,125.14,109.63$ (Ar-C-C), $65.71\left(\mathrm{OCH}_{2}\right), 28.34\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 28.08\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.32\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $13.95\left(\mathrm{C}_{3}\right)$; GC: $\mathrm{t}_{\mathrm{R}} 11.07 \mathrm{~min}$; LRMS (EI): $366\left(M^{+}, 10 \%\right), 296\left(M^{+}-\mathrm{C}_{5} \mathrm{H}_{10}\right.$, 100\%).

## 3,5-Dibromo-4-hydroxy-benzoic acid hexyl ester (248)

Compound 248 was synthesised in the same way as compound 245, except that 3,5 -dibromo-4-hydroxy-benzoic acid $(1.03 \mathrm{~g}, 3.48 \mathrm{mmol}$ ), and hexanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave a crude oil. Flash column chromatography of the crude oil gave 248 as a yellow solid ( $0.93 \mathrm{~g}, 70.45 \%$ yield) [m.p. $59.1-59.6^{\circ} \mathrm{C}$; $R_{f} 0.46$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(10: 90)$ ].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3374.20(\mathrm{OH}), 2930.10(\mathrm{CH}), 1703.00(\mathrm{C}=\mathrm{O}), 1587.80$, 1557.60, 1474.80, $1399.60(\mathrm{ArC=C}), 1256.20(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) ; 8.14(2 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\underline{\mathrm{H}}), 6.33(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.28\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH} \underline{H}_{2}\right), 1.71-1.90(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right), 1.22-1.49\left[6 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right) 4 \mathrm{CH}_{3}\right], 0.90\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ;$ $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : 164.05 ( $\mathrm{C}=\mathrm{O}$ ), 153.05 (Ar- $\left.\underline{\mathrm{C}}-\mathrm{O}\right), 133.55,125.11,109.64$ (Ar- $\underline{-}$ ), $65.73\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 31.42\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 28.39\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 25.61$ $\left(\mathrm{C}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.51\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 13.99\left(\mathrm{C}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 11.66 \mathrm{~min} ; \quad$ LRMS (EI): $380\left(M^{+}, 9 \%\right), 296\left(M^{+}-\mathrm{C}_{6} \mathrm{H}_{12}, 100 \%\right)$.

## 3,5-Dibromo-4-hydroxy-benzoic acid heptyl ester (249)

Compound 249 was synthesised in the same way as compound 245, except that 3,5 -dibromo-4-hydroxy-benzoic acid ( $1.00 \mathrm{~g}, 3.38 \mathrm{mmol}$ ), and heptanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave a crude oil. Flash column chromatography of the crude oil gave 249 as a pale yellow solid $(0.82 \mathrm{~g}, 61.65 \%$ yield) [m.p. 68.5$69.2^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.54$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$ ].
$v_{(\text {max) })}$ (Film) $\mathrm{cm}^{-1}: 3386.00(\mathrm{OH}), 2928.20(\mathrm{CH}), 1702.20(\mathrm{C}=\mathrm{O}), 1587.80$, 1558.90, 1473.60, 1399.40 ( $\mathrm{ArC=C}$ ), $1257.20(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.14(2 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\underline{\mathrm{H}}), 6.28(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.30\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2}\right), 1.70-1.91(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 1.21-1.49\left[8 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 0.89\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ;$ $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : $164.04(\underline{\mathrm{C}}=\mathrm{O}), 153.03$ ( $\mathrm{Ar}-\underline{-}-\mathrm{O}$ ), 133.56, 125.14, 109.64 ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), $65.74\left(\mathrm{O}_{2}\right), 31.68\left[\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right], 28.91\left(\mathrm{CH}_{2}\right), 28.63\left(\mathrm{CH}_{2}\right), 25.91$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.58\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 14.05\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 12.40 \mathrm{~min} ;$ LRMS (EI): $394\left(M^{+}, 3 \%\right), 296\left(M^{+}-\mathrm{C}_{7} \mathrm{H}_{14}, 100 \%\right)$.

## 3,5-Dibromo-4-hydroxy-benzoic acid octyl ester (250)

Compound 250 was synthesised in the same way as compound 245, except that 3,5 -dibromo-4-hydroxy-benzoic acid $(1.00 \mathrm{~g}, 3.38 \mathrm{mmol})$, and octanol $(10 \mathrm{~mL})$ was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave the crude as an oil. Flash column chromatography of the crude oil gave $\mathbf{2 5 0}$ as a white solid $(0.89 \mathrm{~g}, 64.49 \%$ yield) [m.p. 65.1$66.2^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.50$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(20: 80)$ ].

## 3,5-Dibromo-4-hydroxy-benzoic acid cyclopentyl ester (253)

Compound 253 was synthesised in the same way as compound 245, except that 3,5 -dibromo-4-hydroxy-benzoic acid $(0.94 \mathrm{~g}, ~ 3.18 \mathrm{mmol})$, and cyclopentanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave the crude as an oil. Flash column chromatography of the crude oil gave $\mathbf{2 5 3}$ as pale brown crystals $(0.68 \mathrm{~g}$, $58.62 \%$ yield) [m.p. $145.7-146.2^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.70$ diethyl ether/petroleum ether 40 $\left.60^{\circ} \mathrm{C}(20: 80)\right]$.
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3335.70(\mathrm{OH}), 2966.50(\mathrm{CH}), 1701.90(\mathrm{C}=\mathrm{O}), 1588.00$, 1553.30, 1478.10, $1366.10(\mathrm{Ar} \mathrm{C=C}), 1257.30(\mathrm{C}-\mathrm{O}) ; ~ \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) ; 8.10(2 \mathrm{H}, \mathrm{s}$, Ph-H), 6.25 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{OH}$ ), $5.28-5.45$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}), 1.88-2.07\left[8 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{4}\right.$, cyclo]; $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right.$ ): 163.73 ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 152.93 (Ar- $\left.-\mathrm{C}-\mathrm{O}\right), 133.49,125.51,109.58$ (Ar- $\underline{\mathrm{C}}), 77.32(\mathrm{O} \underline{\mathrm{C}} \mathrm{H}), 32.73\left(\mathrm{OCH} \mathrm{CH}_{2}\right.$, cyclo), $23.79\left(\underline{\mathrm{C}}_{2}\right.$, cyclo); GC: LRMS (EI): $\mathrm{t}_{\mathrm{R}} 11.52 \mathrm{~min} ; 364\left(M^{+}, 5 \%\right), 279\left(M^{+}-\mathrm{OC}_{5} \mathrm{H}_{9}, 100 \%\right)$.

## 3,5-Dibromo-4-hydroxy-benzoic acid cyclohexyl ester (254)

Compound 254 was synthesised in the same way as compound 245, except that 3,5 -dibromo-4-hydroxy-benzoic acid ( $1.00 \mathrm{~g}, 3.38 \mathrm{mmol}$ ), and cyclohexanol $(10 \mathrm{~mL})$ was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave the crude as an oil. Flash column chromatography of the crude oil gave $\mathbf{2 5 4}$ as a pale brown solid ( $0.68 \mathrm{~g}, 53.13 \%$ yield) [m.p. $126.3-126.8^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.39$ diethyl ether/ petroleum ether $\left.40-60^{\circ} \mathrm{C}(20 ; 80)\right]$.
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3367.80(\mathrm{OH}), 2934.00(\mathrm{CH}), 1700.00(\mathrm{C}=\mathrm{O}), 1587.70$, $1478.50,1450.80,1399.70(\mathrm{ArC=C}), 1253.80(\mathrm{C}-\mathrm{O}) ; ~ \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.07(2 \mathrm{H}, \mathrm{s}$, $\mathrm{Ph}-\underline{\mathrm{H}}), 6.25(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.88-4.99(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}), 1.40-1.58\left[10 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{5}\right.$, cyclo]; $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right.$ ): 162.14 ( $\underline{\mathrm{C}}=\mathbf{O}$ ), 151.72 ( $\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}$ ), 132.30, 124.34, 108.36 (Ar-C $), 72.73(\mathrm{OCH}), 30.38\left(\mathrm{CHCH}_{2}\right), 24.11\left(\mathrm{C}_{2}\right.$, cyclo $), 22.50\left(\underline{C}_{2}\right.$, cyclo); GC: $\mathrm{t}_{\mathrm{R}} 12.35 \mathrm{~min} ;$ LRMS ( El$): 378\left(M^{+}, 5 \%\right), 82\left(M^{+}-\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{Br}_{2} \mathrm{O}_{3}, 100 \%\right)$.

## 3,5-Dibromo-4-hydroxy-benzoic acid cycloheptyl ester (255)

Compound 255 was synthesised in the same way as compound 245 except that 3,5 -dibromo-4-hydroxy-benzoic acid $(1.06 \mathrm{~g}, 3.58 \mathrm{mmol})$, and cycloheptanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave the crude as an oil. Flash column chromatography of the crude oil gave 255 as shiny white crystals 0.05 g , $3.57 \%$ yield) [m.p. $120.2-121.4^{\circ} \mathrm{C}$; Rf 0.36 diethyl ether/petroleum ether 40 $60^{\circ} \mathrm{C}(20: 80)$ ].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 3390.00(\mathrm{OH}), 2926.90(\mathrm{CH}), 1699.50(\mathrm{C}=\mathrm{O}), 1601.00$, $1570.00,1475.30,1295.60(\mathrm{ArC=C}), 1258.50(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.06(2 \mathrm{H}, \mathrm{s}$,
 cyclo]; $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : 163.10 ( $\underline{C}=\mathrm{O}$ ), 153.00 ( $\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}$ ), 133.51, 125.91, 109.57 (Ar- $\underline{C}$ ), $33.80\left(\mathrm{OCH} \underline{\mathrm{C}} \mathrm{H}_{2}\right), 28.27\left(\underline{\mathrm{C}}_{2}\right.$, cyclo $), 22.85\left(\mathrm{C}_{2}\right.$, cyclo); GC: $\mathrm{t}_{\mathrm{R}} 13.69$ min; LRMS (EI): $392\left(M^{+}, 2 \%\right), 96\left(M^{+}-\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{O}_{3} \mathrm{Br}_{2}, 100 \%\right)$.

## 3,5-Dibromo-4-hydroxy-benzoic acid cyclooctyl ester (256)

Compound 256 was synthesised in the same way as compound $\mathbf{2 4 5}$, except that 3,5-dibromo-4-hydroxy-benzoic acid (1.02g 3.45 mmol ), and cyclooctanol
( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave the crude as an oil. Flash column chromatography of the crude oil gave $\mathbf{2 5 6}$ as shiny white crystals ( $0.62 \mathrm{~g}, \mathbf{4 4 . 2 9 \%}$ ) [m.p. 153.6$154.2^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.62$ diethyl ether/petroleum ether $\left.40-60^{\circ} \mathrm{C}(20: 80)\right]$.
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3374.90(\mathrm{OH}), 2923.20(\mathrm{CH}), 1697.10(\mathrm{C}=\mathrm{O}), 1587.40$, 1557.40, 1475.10, 1399.60 ( $\mathrm{ArC=C}$ ), $1255.70(\mathrm{C}-\mathrm{O}) ; ~ \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.05(2 \mathrm{H}, \mathrm{s}$, Ph-ㅐㅡ), 6.19 (1H, s, OH$), 5.01-5.18$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}), 1.39-1.58\left[14 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)\right.$, cyclo]; $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right.$ ): 163.10 ( $\mathrm{C}=\mathrm{O}$ ), 152.01 ( $\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}$ ), 133.51, 125.90, 109.57 (Ar- $-\mathbf{C}), 31.50\left(\mathrm{OCH} \underline{C H}_{2}\right), 27.09\left(\underline{\mathrm{C}_{2}}\right), 25.34\left(\mathrm{CH}_{2}\right.$, cyclo $), 22.91\left(\underline{\mathrm{C}}_{2}\right.$, cyclo); GC: $t_{R} 15.25 \mathrm{~min} ;$ LCMS (EI): 406 ( $\left.M^{+}, 7 \%\right), 82\left(M^{+}-\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{O}_{3} \mathrm{Br}, 100 \%\right)$.

### 4.9 Synthesis of 3-Bromo-4-hydroxy-benzoic acid alkyl/cycloalkyl esters

## 3-Bromo-4-hydroxy-benzoic acid methyl ester (257)

3-Bromo-4-hydroxy-benzoic acid ( $1.08 \mathrm{~g}, 4.98 \mathrm{mmol}$ ), methanol ( 10 mL ) and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(1 \mathrm{~mL})$ were dissolved in toluene $(25 \mathrm{~mL})$, and the mixture was refluxed for 6 h . After cooling to room temperature, the mixture was neutralised with 2 M NaOH and was allowed to stand for 15 min , before being poured into a solution of ice/water. A precipitate was observed, which was then filtered and dried to give $\mathbf{2 5 7}$ as a white solid ( $0.37 \mathrm{~g}, 32.17 \%$ yield) [m.p. $114.1-114.6^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.33$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. 107-108 ${ }^{\circ} \mathrm{C}$ (Cavill, 1945)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3347.50(\mathrm{OH}), 1693.30(\mathrm{C}=\mathrm{O}), 1601.00(\mathrm{C}=\mathrm{C}), 1437.10$ $(\mathrm{CH}), 1290.30$ (C-O), 1193.80 (C-C), 1117.50 (C-C); $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.19$ ( $2 \mathrm{H}, \mathrm{d}$, $J=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 7.91$ ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}$ ), 7.05 ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-$ H), $6.02(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 165.61$ ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 156.18
 GC: $t_{R} 6.73 \mathrm{~min} ;$ LRMS (EI): $231\left(M^{+}, 40 \%\right), 200\left(M^{+}-\mathrm{OCH}_{3}, 100 \%\right)$.

## 3-Bromo-4-hydroxy-benzoic acid ethyl ester (258)

Compound 258 was synthesised in a similar manner to $\mathbf{2 5 7}$ except 3-bromo-4-hydroxy-benzoic acid ( $1.11 \mathrm{~g}, 5.12 \mathrm{mmol}$ ), and ethanol ( 10 mL ) was used instead of methanol. The precipitate was filtered and dried to give 257 as a white solid ( $0.67 \mathrm{~g}, 53.60 \%$ yield) [m.p. $117.4-117.9^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.35$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $103^{\circ} \mathrm{C}$ (Meyer, 1901)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3236.00(\mathrm{OH}), 1676.70(\mathrm{C}=\mathrm{O}), 1603.90(\mathrm{C}=\mathrm{C}), 1423.50$ (CH), 1394.30 (CH), 1369.90 (CH), 1292.50 (C-O), 1145.60 (C-C), 1045.10 $(\mathrm{C}-\mathrm{C}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.18(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.92(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{Ph}-$ H), $7.05(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 5.98(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.35(2 \mathrm{H}, \mathrm{q}, \mathrm{J}=7.00 \mathrm{~Hz}$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 1.38\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : $164.85(\underline{\mathrm{C}}=\mathrm{O}), 156.06(\mathrm{Ar}-\underline{\mathrm{C}})$, 133.85, 130.99, 115.72 ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), 110.03 ( $\underline{\mathrm{C}}-\mathrm{Br}$ ), $61.13\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 14.31$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 7.48 \mathrm{~min} ;$ LRMS (EI): $246\left(M^{+}, 41 \%\right), 199\left(M^{+}-\mathrm{OC}_{2} \mathrm{H}_{7}\right.$, 100\%).

3-Bromo-4-hydroxy-benzoic acid ( $1.10 \mathrm{~g}, 5.07 \mathrm{mmol}$ ), propan-1-ol ( 10 mL ) and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ ( 1 mL ) were dissolved in toluene $(25 \mathrm{~mL})$, and the mixture was refluxed for 6 h . After cooling to room temperature, the mixture was neutralised with 2 M NaOH . It was then allowed to stand for 15 min , before being poured into a solution of ice/water and then extracted into DCM ( 25 mL ). The organic phase was dried over anhydrous $\mathrm{MgSO}_{4}$ and the mixture was filtered. Removal of the solvent in vacuo gave 259 as a white solid $(0.69 \mathrm{~g}$, $52.67 \%$ yield) [m.p. $87.3-87.8^{\circ} \mathrm{C}$; Rf 0.33 diethyl ether/petroleum ether 40 $60^{\circ} \mathrm{C}(30: 70)$; lit. m.p. $88-89^{\circ} \mathrm{C}$ (Hirai, 1957)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3310.50(\mathrm{OH}), 2969.40(\mathrm{CH}), 1684.20(\mathrm{C}=\mathrm{O}), 1601.20$ (C=C), 1496.001391 .50 ( $\mathrm{ArC=C}$ ), $1286.90(\mathrm{C}-\mathrm{O}), 1115.90(\mathrm{C}-\mathrm{C}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right)$ : $8.17(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.92(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.04(2 \mathrm{H}, \mathrm{d}$, $J=7.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.0(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.25\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2}\right), 1.73-1.82$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.01\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right) ; 165.11(\underline{\mathrm{C}}=\mathrm{O})$, 155.39 ( $\mathrm{Ar}-\underline{\mathrm{C}}$ ), 133.82, 130.99, 115.72, 109.62 ( $\mathrm{Ar}-\underline{\mathrm{C}}), 66.70\left(\mathrm{OCH}_{2}\right), 22.09$ $\left(\underline{C}_{2} \mathrm{CH}_{3}\right), 10.49\left(\mathrm{CH}_{2} \underline{\mathrm{C}}_{3}\right) ; G C: \mathrm{t}_{\mathrm{R}} 7.93 \mathrm{~min} ;$ LRMS $(\mathrm{EI}): 258\left(M^{+}, 8 \%\right), 199$ $\left(M^{+}-\mathrm{OC}_{3} \mathrm{H}_{7}, 100 \%\right)$.

## 3-Bromo-4-hydroxy-benzoic acid butyl ester (260)

Compound 260 was synthesised in the same way as compound 259, except that 3-bromo-4-hydroxy-benzoic acid ( $1.08 \mathrm{~g}, 4.98 \mathrm{mmol}$ ), and butanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent in vacuo gave $\mathbf{2 6 0}$ as a white solid $\left(0.77 \mathrm{~g}, 56.62 \%\right.$ yield) [m.p. $91.2-91.7^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.38$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit.m.p. $83-84^{\circ} \mathrm{C}$ (Cavill, 1945)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3329.10(\mathrm{OH}), 2959.10(\mathrm{CH}), 1691.70(\mathrm{C}=\mathrm{O}), 1602.10$, 1508.20, 1424.10 (Ar), 1288.00 (C-O); $\delta_{H}\left(\mathrm{CDCl}_{3}\right): 8.18$ ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}$, PhH), $7.92(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 7.05(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 5.96(1 \mathrm{H}, \mathrm{s}$, $\mathrm{OH}), 4.30\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2}\right), 1.74\left(2 \mathrm{H}\right.$, quin, $\mathrm{J}_{A B}=7.00 \mathrm{~Hz}, \mathrm{~J}_{A B}=8.00 \mathrm{~Hz}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.46\left(2 \mathrm{H}\right.$, sex, $\left.\mathrm{J}_{\mathrm{AB}}=7.00 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=8.00 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 0.98(3 \mathrm{H}, \mathrm{t}$, $\mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right.$ ): 165.11 ( $\mathrm{C}=\mathrm{O}$ ), 156.05 (Ar- $\underline{\mathrm{C}}-\mathrm{O}$ ), 133.82, 130.98, 115.72 (Ar- $\underline{\mathrm{C}}$ ), $65.01\left(\mathrm{OCH}_{2}\right), 30.74\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 19.24\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 13.75$ $\left(\mathrm{CH}_{3}\right) ;$ GC: $\mathrm{t}_{\mathrm{R}} 8.61 \mathrm{~min} ;$ LRMS (EI): $272\left(M^{+}, 8 \%\right), 216\left(M^{+}-\mathrm{C}_{4} \mathrm{H}_{8}, 100 \%\right)$,

## 3-Bromo-4-hydroxy-benzoic acid pentyl ester (261)

Compound 261 was synthesised in the same way as compound 259, except that 3-bromo-4-hydroxy-benzoic acid ( $1.17 \mathrm{~g}, 5.39 \mathrm{mmol}$ ), and pentanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave $\mathbf{2 6 1}$ as a white solid ( $0.63 \mathrm{~g}, 40.65 \%$ yield) [m.p. 66.7-67.2 ${ }^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.29$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit.m.p. $64-66^{\circ} \mathrm{C}$ (Hirai, 1957)].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3357.80(\mathrm{OH}), 2957.80(\mathrm{CH}), 1686.40(\mathrm{C}=\mathrm{O}), 1600.90$, 1415.10, 1410.10 (Ar), $1287.30(\mathrm{C}-\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 8.18$ ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}$, PhH), $7.93(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 7.05(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 6.04(1 \mathrm{H}, \mathrm{s}$, $\mathrm{OH}), 4.29\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2}\right), 1.72-1.79\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 1.42-1.51$ ( $4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $0.93\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 165.21$ ( $\left.\mathrm{C}=\mathrm{O}\right)$, 156.09 (Ar- $-\mathbf{C}-\mathrm{O}), 133.85,130.96,124.40,110.04$ ( $\mathrm{Ar}-\underline{\mathrm{C}}), 65.32\left(\mathrm{OCH}_{2}\right), 28.39$ $\left(\mathrm{OCH}_{2} \underline{\mathrm{CH}_{2}}\right), 28.13\left(\mathrm{C}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.33\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right], 13.96\left(\mathrm{C}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 9.29$ min ; LRMS (EI): $286\left(M^{+}, 5 \%\right), 216\left(M^{+}-\mathrm{C}_{5} \mathrm{H}_{10}, 100 \%\right)$.

## 3-Bromo-4-hydroxy-benzoic acid hexyl ester (262)

Compound 262 was synthesised in the same way as compound 259, except that 3-bromo-4-hydroxy-benzoic acid ( $1.06 \mathrm{~g}, 4.88 \mathrm{mmol}$ ), and hexanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave 262 as a pale yellow solid ( $0.67 \mathrm{~g}, 45.58 \%$ ) [m.p. $65.7-66.2^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.29$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$; lit.m.p. $60-62^{\circ} \mathrm{C}$ (Hirai, 1957)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3348.50(\mathrm{OH}), 2930.50(\mathrm{CH}), 1687.40(\mathrm{C}=\mathrm{O}), 1494.60$, $1467.50,1414.20,1390.00(\mathrm{Ar}), 1287.60(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.18(1 \mathrm{H}, \mathrm{d}$, $J=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 7.92$ ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}$ ), 7.05 ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-$ H), $5.98(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.28\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH}_{2}\right), 1.71-1.78(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 1.29-1.37\left[6 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 0.91\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ;$ $\delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right)$ : $165.10(\underline{\mathrm{C}}=\mathrm{O}), 156.14$ ( $\left.\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}\right), 133.83,130.96,115.72$ ( $\left.\mathrm{Ar}-\underline{\mathrm{C}}\right)$, $65.32\left(\mathrm{OCH}_{2}\right), 31.44\left(\mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 28.64\left[\left(\mathrm{C}_{2}\right)_{2} \mathrm{CH}_{3}\right], 25.66\left(\mathrm{C}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, $22.52\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 13.99\left(\mathrm{C}_{3}\right) ;$ GC: $\mathrm{t}_{\mathrm{R}} 9.87 \mathrm{~min} ;$ LRMS (EI): $300\left(\mathrm{M}^{+}, 6 \%\right), 216$ $\left(M^{+}-\mathrm{C}_{6} \mathrm{H}_{12}, 100 \%\right)$.

## 3-Bromo-4-hydroxy-benzoic acid heptyl ester (263)

Compound 263 was synthesised in the same way as compound 259, except that 3-bromo-4-hydroxy-benzoic acid (1.01g, 4.65 mmol ), and heptanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave 263 as a pale yellow solid $(0.54 \mathrm{~g}, 36.73 \%$ yield) [m.p. 65.8 $66.3^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.39$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}$ ( $40: 60$ ); lit.m.p. $58-$ $59^{\circ} \mathrm{C}$ (Hirai, 1957)].
$v_{(\max )}($ Film $) \mathrm{cm}^{-1}: 3360.00(\mathrm{OH}), 2928.27(\mathrm{CH}), 1686.86(\mathrm{C}=\mathrm{O}), 1495.58$, 1413.17 (Ar), $1286.92(\mathrm{C}-\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 8.17(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.92$ (1H, d, J=7.00Hz, Ph-H $), 7.05(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 5.98(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.28$ $\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OC} \underline{H}_{2}\right), 1.75\left(2 \mathrm{H}\right.$, quin, $\left.\mathrm{J}_{\mathrm{AB}}=7.00 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=8.00 \mathrm{~Hz}, \mathrm{OCH}_{2} \mathrm{CH}_{2}\right)$, 1.25-1.36 [8H, m, $\left.\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 0.89\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right): 165.35$ ( $\underline{C}=0$ ), 156.05 (Ar- $\underline{C}-\mathrm{O}), 133.83,124.19,109.87(\operatorname{Ar}-\underline{\mathrm{C}}), 65.33\left(\mathrm{OCH}_{2}\right), 31.70$ $\left(\mathrm{OCH}_{2} \underline{\mathrm{C}} \mathrm{H}_{2}\right), 28.93\left(\underline{\mathrm{C}}_{2}\right), 28.60\left(\underline{\mathrm{C}} \mathrm{H}_{2}\right), 25.96\left(\underline{\mathrm{C}}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 22.58\left(\underline{\mathrm{C}} \mathrm{H}_{2} \mathrm{CH}_{3}\right)$, $14.05\left(\mathrm{C}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 10.39 \mathrm{~min}$; LRMS (EI): $314\left(M^{+}, 8 \%\right), 216\left(M^{+}-\mathrm{C}_{7} \mathrm{H}_{14}\right.$, 100\%).

## 3-Bromo-4-hydroxy-benzoic acid octyl ester (264)

Compound 264 was synthesised in the same way as compound 259, except that 3-bromo-4-hydroxy-benzoic acid ( $1.10 \mathrm{~g}, 5.07 \mathrm{mmol}$ ), and octanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave 264 as a white solid $\left(0.63 \mathrm{~g}, 37.72 \%\right.$ yield) [m.p. $41.7-42.2^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.42$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(40: 60)$; lit. m.p. $45-47^{\circ} \mathrm{C}$ (Hirai, 1957)].
$v_{\text {(max) }}$ (Film) $\mathrm{cm}^{-1}: 3362.02(\mathrm{OH}), 2926.41(\mathrm{CH}), 1686.54(\mathrm{C}=\mathrm{O}), 1600.37$, 1412.94 (Ar), $1286.63(\mathrm{C}-\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right): 8.18$ (1H, d, J=8.00Hz, Ph-H), 7.92 $(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.04(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 5.98(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.28$ $\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{OCH} \underline{H}_{2}\right), 1.75\left(2 \mathrm{H}\right.$, quin, $\left.\mathrm{J}_{\mathrm{AB}}=9.00 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=8.00 \mathrm{~Hz}_{1} \mathrm{OCH}_{2} \mathrm{CH}_{2}\right)$, $1.25-1.36\left[10 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{3}\right], 0.88\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right) ;$ 165.35 ( $\mathrm{C}=\mathrm{O}$ ), 155.89 (Ar- $\mathrm{C}-\mathrm{O}$ ), 133.82, 130.98, 124.19, 115.72, 109.87 (ArC $)$, $65.34\left(\mathrm{OCH}_{2}\right), 31.78\left(\mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 28.83\left(\mathrm{C}_{2}\right), 28.68\left(\mathrm{C}_{2}\right), 25.96\left(\mathrm{CH}_{2}\right)$, $22.64\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 14.07\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 11.22 \mathrm{~min} ;$ LRMS (EI): $329\left(M^{+}, 3 \%\right)$, $218\left(M^{+}-\mathrm{C}_{8} \mathrm{H}_{15}, 100 \%\right)$.

## 3-Bromo-4-hydroxy-benzoic acid nonyl ester (265)

Compound 265 was synthesised in the same way as compound 259, except that 3 -bromo-4-hydroxy-benzoic acid ( $1.2 \mathrm{~g}, 5.53 \mathrm{mmol}$ ), and nonanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave $\mathbf{2 6 5}$ as a white solid $\left(0.23 \mathrm{~g}, 12.11 \%\right.$ yield) [m.p. $48.7-49.2^{\circ} \mathrm{C}$; $R_{f} 0.29$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$ ].
$v_{(\max )}$ (Film) $\mathrm{cm}^{-1}: 3339.40(\mathrm{OH}), 2924.80(\mathrm{CH}), 1688.30(\mathrm{C}=0), 1600.40(\mathrm{Ar}$ $\mathrm{C}=\mathrm{C}), 1286.90(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.18(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.93(1 \mathrm{H}, \mathrm{d}$, $J=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.05$ (1H, d, J=8.00Hz, Ph-H $), 6.03(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.28(2 \mathrm{H}, \mathrm{t}$, $\left.J=7.00 \mathrm{~Hz}, \mathrm{OCH} \underline{H}_{2}\right), 1.75\left(2 \mathrm{H}\right.$, quin, $\left.\mathrm{J}_{\mathrm{AB}}=7.00 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{AB}}=8.00 \mathrm{~Hz}, \mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 1.21-$ $1.36\left[12 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{6} \mathrm{CH}_{3}\right], 0.88\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right) ; 164.01$ ( $\underline{C}=\mathbf{O}$ ), 155.63 ( $\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}$ ) , 133.90, 131.35, 116.01, 110.13 (Ar-C), 64.87 $\left.\left(\mathrm{O}_{2}\right)_{2}\right), 31.83\left(\mathrm{OCH}_{2} \underline{\mathrm{CH}_{2}}\right), 29.25\left[\mathrm{O}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\right], 22.65\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 14.09$ $\left(\mathrm{C}_{3}\right)$; GC: $\mathrm{t}_{\mathrm{R}} 11.61 \mathrm{~min} ;$ LRMS (EI): $344\left(M^{+}, 2 \%\right), 216\left(M^{+}-\mathrm{C}_{9} \mathrm{H}_{20}, 100 \%\right)$.

## 3-Bromo-4-hydroxy-benzoic acid decyl ester (266)

Compound 266 was synthesised in the same way as compound 259, except that 3-bromo-4-hydroxy-benzoic acid ( $1.2 \mathrm{~g}, 5.53 \mathrm{mmol}$ ), and decanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave $\mathbf{2 6 6}$ as a white solid $\left(0.35 \mathrm{~g}, 17.77 \%\right.$ yield) [m.p. $56.0-56.5^{\circ} \mathrm{C}$; $R_{f} 0.27$ diethyl ether/petroleum ether $40-60^{\circ} \mathrm{C}(30: 70)$ ].
$v_{(\text {max) }}$ (Film) $\mathrm{cm}^{-1}: 3356.55(\mathrm{OH}), 2925.42(\mathrm{CH}), 1686.51(\mathrm{C}=\mathrm{O}), 1601.12$ (Ar $\mathrm{C}=\mathrm{C}), 1287.29(\mathrm{C}-\mathrm{O}) ; \delta_{H}\left(\mathrm{CDCl}_{3}\right) ; 8.18$ ( $\left.1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}\right), 7.91$ (1H, d, $J=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 7.05(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{H}), 6.06(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 4.27(2 \mathrm{H}, \mathrm{t}$, $\left.\mathrm{J}=7.00 \mathrm{~Hz}, \quad \mathrm{OCH} \underline{H}_{2}\right), 1.70-1.81\left(2 \mathrm{H}, \mathrm{m}, \quad \mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 1.20-1.48 \quad[14 \mathrm{H}, \mathrm{m}$, $\left.\left(\mathrm{CH}_{2}\right)_{7} \mathrm{CH}_{3}\right], 0.88\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.00 \mathrm{~Hz}, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{c}}\left(\mathrm{CDCl}_{3}\right): 164.01(\mathrm{C}=\mathrm{O}), 156.08$ (Ar- $-\mathbf{C}-\mathrm{O}$ ), 133.85, 130.96, 124.40, 115.72 (Ar-C-1), $65.34\left(\mathrm{O}_{2} \mathrm{O}_{2}\right), 31.87$ $\left(\mathrm{OCH}_{2} \mathrm{CH}_{2}\right), 29.51\left[\mathrm{O}\left(\mathrm{CH}_{2}\right)_{2} \underline{\mathrm{CH}}_{2}\right], 29.21\left(\mathrm{CH}_{2}\right), 28.67\left(\mathrm{CH}_{2}\right), 25.98\left(\mathrm{CH}_{2}\right)$, $22.65\left(\mathrm{C}_{2} \mathrm{CH}_{3}\right), 14.10\left(\mathrm{CH}_{3}\right) ; \mathrm{GC}: \mathrm{t}_{\mathrm{R}} 12.24 \mathrm{~min} ;$ LRMS (EI): $358\left(M^{+}, 2 \%\right)$, $216\left(M^{+}-\mathrm{C}_{10} \mathrm{H}_{22}, 100 \%\right)$.

## 3-Bromo-4-hydroxy-benzoic acid cyclopentyl ester (267)

Compound 267 was synthesised in the same way as compound 259, except that 3-bromo-4-hydroxy-benzoic acid $(1.2 \mathrm{~g}, 5.53 \mathrm{mmol}$ ), and cyclopentanol ( 10 mL ) was used instead of propan-1-ol. Removal of the solvent using the Kugerhol apparatus gave 267 as white long crystalline crystals ${ }^{(0.39 g}$, $24.68 \%$ ) [m.p. $123.9-124.4^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.13$ diethyl ether/ petroleum ether $40-60^{\circ} \mathrm{C}$ (40:60)].
$v_{(\text {max })}($ Film $) \mathrm{cm}^{-1}: 3339.75(\mathrm{OH}), 2964.58(\mathrm{CH}), 1682.19(\mathrm{C}=\mathrm{O}), 1601.77(\mathrm{Ar}$ $\mathrm{C}=\mathrm{C}), 1287.73(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right): 8.12(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\mathrm{H}), 7.88(1 \mathrm{H}, \mathrm{d}$, $\mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 7.02(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.00 \mathrm{~Hz}, \mathrm{Ph}-\underline{\mathrm{H}}), 5.33-5.37(1 \mathrm{H}, \mathrm{m}, \mathrm{OH}), 1.88-$ $1.97(1 \mathrm{H}, \mathrm{m}, \mathrm{OCH}), 1.74-1.85\left[4 \mathrm{H}, \mathrm{m}, \mathrm{OCH}\left(\mathrm{CH}_{2}\right)_{2}\right.$, cyclo], $1.61-1.68[4 \mathrm{H}, \mathrm{m}$, $\left(\mathrm{CH}_{2}\right)_{2}$, cyclo]; $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right)$ : 165.09 ( $\underline{\mathrm{C}}=\mathrm{O}$ ), 155.37 ( $\left.\mathrm{Ar}-\underline{\mathrm{C}}-\mathrm{O}\right), 133.73,130.92$, 124.69, $115.66(\mathrm{Ar}-\underline{\mathrm{C}}), 110.12(\mathrm{O} \underline{\mathrm{CH}}), 32.75\left[\left(\underline{\mathrm{CH}_{2}}\right)_{2}\right.$, cyclo], $23.80\left[\left(\underline{\mathrm{C}_{2}}\right)_{2}\right.$, cyclo]; GC: $t_{R} 9.58 \mathrm{~min} ;$ LRMS (EI): $284\left(M^{+}, 3 \%\right), 199\left(M^{+}-\mathrm{OC}_{5} \mathrm{H}_{9}, 100 \%\right)$.

## CHAPTER 5

## Biochemical evaluation of

 compounds against HSD
## enzymes

### 5.1 Biochemical evaluation of compounds against HSD enzymes

A small range of the phenyl ketone based compounds (as potential inhibitors of $17 \beta$-HSD isozymes) were evaluated (by Dr. Sachin Dhanani at Kingston University) against rat testicular microsomal enzyme. In particular, the compounds based on 4-hydroxyphenyl ketone (compounds 158 to 172) and biphenyl ketone (compounds 202 to 214) were evaluated against type 1 and type 3 isozymes of $17 \beta$-HSD. In an effort to determine specificity towards $17 \beta$ HSD, the compounds were also evaluated against $3 \beta-H S D$. The results are therefore quoted as the mean of triplicate determinations ( $n=9$ ) (Table 5.15.6).

| Structure | \% Inhibition at $100 \mu \mathrm{M}$ | $\mathrm{IC}_{50}$ Value $(\mu \mathrm{M})$ |
| :---: | :---: | :---: |

## CHAPTER 6

## Discussion of biological <br> data

### 6.1 Discussion of Biological data

As described above, the compounds synthesised within the currently study were evaluated against three HSD enzymes, namely: $17 \beta$-HSD3, 17 $\beta$-HSD1 and $3 \beta$-HSD. The latter enzyme was chosen so as to evaluate the potential specificity of the synthesised compounds against the general family of HSD enzymes. In an effort of gain some data as to the level of inhibition observed within the synthesised compounds in comparison to previously reported inhibitors, we considered the flavonoid based compounds. That is, a number of workers within the field have previously undertaken biochemical evaluation of flavonoid-based compounds, in particular, Baicalein and 7-hydroxyflavone, as such, these two compounds were evaluated with our novel inhibitors for comparison.

### 6.2 Inhibition of $\mathbf{1 7} \boldsymbol{\beta}$-HSD3

The results of the biochemical evaluation of the potential inhibitors of $17 \beta$ HSD3 (Tables 5.1 and 5.2) show that the 4-hydroxyphenyl ketone-based compounds are potent inhibitors of $17 \beta$-HSD3, in comparison to the two standards used. Detailed consideration of the biochemical data shows that there are two compounds that are potent inhibitors of this isozyme, namely $165\left(\mathrm{IC}_{50}=2.86 \mu \mathrm{M}\right)$ and $166\left(\mathrm{IC}_{50}=4.97 \mu \mathrm{M}\right)$. As such, 165 is around 65 and 23 times more potent than Baicalein ( $\mathrm{IC}_{50}=185.92 \mu \mathrm{M}$ ) and 7-hydroxyflavone ( $\mathrm{IC}_{50}=66.98 \mu \mathrm{M}$ ) respectively. A number of other compounds also show good inhibitory activity, for example, compounds 163 ( $\mathrm{IC}_{50}=7.84 \mu \mathrm{M}$ ), 164 ( $\mathrm{IC}_{50}=6.52 \mu \mathrm{M}$ ) and 168 ( $\mathrm{IC}_{50}=7.55 \mu \mathrm{M}$ ) possess good inhibitory activity in comparison to the two standard compounds.

A detailed consideration of the observed inhibitory activity within the 4hydroxyphenyl ketone based compounds show that there is a good correlation between the potency of the compounds and the alkyl chain length, that is, the inhibitory activity increases with increasing alkyl chain length [and therefore the logarithm of the calculated partition coefficient (logP) (calculated using

Quantum CaChe Project Leader, Fujitsu Ltd)]. Indeed a plot of logP versus $\mathrm{IC}_{50}$ supports the initial observation resulting in a very good correlation ( $\mathrm{R}^{2}=0.95$ ) (Figure 6.1). Consideration of the Figure 6.1 shows that there is an optimum $\log \mathrm{P}$ of approximately 3.8 and 4.3 and which corresponds approximately to compound 256.

Molecular modelling of these compounds were undertaken within our group (Lota et al, 2006) which suggested that the 4-hydrophenyl ketone-based inhibitors may possess two possible modes of binding to the $17 \beta$-HSD3 active site when superimposed onto the steroid backbone (it should be noted that currently, there are no reported crystal structures of $17 \beta$-HSD3, as such, the modelling study was initially undertaken so as to gain valuable information regarding the active site of this isozyme). That is, the inhibitors are presumed to bind to the active site where the carbonyl moiety [as previously suggested by Owen and Ahmed (2004)] within the inhibitor mimics the $C(17)=O$ of the substrate and therefore is presumably reduced by NADPH within the $17 \beta$ HSD3 active site. As such, one mode of binding involves the alkyl chain extending towards the area of space normally occupied by the steroid backbone (i.e. rings $\mathrm{A}, \mathrm{B}$ and C ), placing the 4 -hydroxyphenyl moiety beyond the (C15) and $\mathrm{C}(16)$ position of the steroid backbone (Figure 6.2). The alternative mode of superimpositioning involves the 4-hydroxyphenyl being positioned so that the alkyl chain is extended far beyond the D-ring (Figure 6.3).

Figure 6.1: Plot of $\mathrm{IC}_{50}$ versus calculated $\log \mathrm{P}$ for a small range of the compounds (from 5 to 10) synthesised within the current study (Lota et al, 2006).

Figure 6.2: Superimposing of novel inhibitor onto the backbone of $A$

Figure 6.3: Alternative mode of superimposing of novel inhibitor onto the backbone of A

As previously mentioned, Owen and Ahmed (2004) have previously suggested that the area of the enzyme active site corresponding to the D-ring of the natural substrate may be populated with hydrogen donor and bonding groups as well as NADPH co-factor. As such, binding in such a manner where 'large' alkyl chain extends out beyond the D-ring as suggested by Figure 6.3 is highly unlikely due to steric interactions which would therefore lead to reduced inhibitory activity. We therefore suggest that the mode of binding suggested in Figure 6.2 is more preferable and is the mode of binding for the majority of the compounds - the modelling of compounds 165 and 159, small alkyl chain containing compounds (Figures 6.3 and 6.4) shows the superimpositioning of the inhibitors onto the steroid backbone in such a manner.

Furthermore, from the consideration of the potency of the larger alkyl chain containing compounds, we suggest that the 4-hydroxyphenyl moiety may be involved in hydrogen bonding interactions with the active site about the $\mathrm{C}(15)$ and $\mathrm{C}(16)$ area of the steroid backbone and which would result in stronger binding and therefore increased inhibitory activity.

Figure 6.3: Superimposition of a low energy conformer of $\mathbf{1 6 5}$ (in ball and stick representation) onto the backbone of A (Lota et al, 2006).

Figure 6.4: Superimposition of 159 (in ball and stick representation) onto the backbone of $A$ (Lota et al, 2006).

That the 4-hydroxyl moiety is able to undergo this favourable hydrogen bonding interaction, resulting in the increased potent inhibitory activity observed within the larger inhibitors of $17 \beta-H S D 3$, is supported by the observation (Dhanani, 2006) that compounds lacking hydrogen bonding substituents on the phenyl moiety possessed extremely poor inhibitory activity. Furthermore, the poor inhibitory activity observed within the biphenyl based compounds would appear to further support our hypothesis regarding the ability of the larger alkyl chain containing compounds to be involved in hydrogen bonding to groups within the active site of $17 \beta$-HSD3.

### 6.3 Inhibition of $17 \beta$-HSD1

The compounds were also evaluated against $17 \beta$-HSD1 in an effort to evaluate the selectivity of the 4-hydroxyphenyl ketones range of compounds. From the consideration of the results, we observe that these compounds possess poor inhibitory activity and would appear therefore to be selective inhibitors of the $17 \beta$-HSD family of enzymes.

The biphenyl-based compounds, however, possess some potency against this isozyme, as such, this would appear to be initially an interesting observation whereby the loss of a hydrogen bonding group and replacement
with a hydrophobic moiety results in a 'switch' from being $17 \beta-H S D 3$ inhibitors to $17 \beta$-HSD1 inhibitors. As previously mentioned, the structure of $17 \beta-H S D 1$ has previously been reported and the orientation of groups about the active site has also been proposed (Sawacki et al, 1999). An initial modelling study undertaken by Ahmed (2005) and Olusanjo et al (2007) involved the superimposition of a range of compounds onto the natural substrate bound to active of $17 \beta-$ HSD1. From his study, Ahmed was therefore able to rationalise the inhibitory activity of a range of the compounds synthesised within the current study.

In general, the 4-hydroxyphenyl ketone based compounds were found to be positioned such that the long alkyl chain containing compounds (e.g. 166) were found to undergo steric interaction with the co-factor, where as the smaller alkyl chain containing compounds (e.g. 158) were found to be positioned within the active site such that they are not involved in any steric interaction (Figure 6.5).

Figure 6.5: Superimposition of compounds 166 (in purple) and 158 (in green) onto the steroid backbone complexed within $17 \beta-H S D 1$.

As such, the modelling study suggests that in the inhibition of $17 \beta$-HSD1, small alkyl chain containing compounds are required so as to be able to fit within the active site. Furthermore, in their study, Olusanjo et al (2007) superimposed compounds 205 and 214 which were found to possess good inhibitory activity against 17 $\beta$-HSD1 (Figure 6.6).

Figure 6.6: To show the superimpositioning of compounds 205 (in green) and 214 (in purple) onto the steroid backbone complexed within 173-HSD1.

From the superimpositioning study, we observe that (as with $17 \beta$-HSD3) the longer alkyl chain containing compound (Figure 6.6; in green) undergoes steric interaction whilst the cyclic based compound (and which therefore possess shorter overall length) is found to possibly undergo less steric interaction due to the smaller overall size of the cyclic moiety. With respect to the increased inhibitory activity observed within these compounds against 17ß-HSD1, Olusanjo et al hypothesise that logP may also be a contributory factor in determining the overall inhibitory activity. That is, consideration of the calculated $\log \mathrm{P}$ values shows that estrone is found to possess a $\log \mathrm{P}$ value of 4.54 whilst compounds 205 and 214 are found to possess logP values of 4.86 and 4.92 respectively

### 6.4 Inhibition of $3 \beta-H S D$

All the potential 173-HSD1 and 17ß-HSD3 inhibitors were evaluated against $3 \beta-H S D$ in an effort to determine the general specificity of the synthesised compounds against the overall family of HSD enzymes. From the consideration of the observed inhibitory activity, it would appear that the designed compounds are all, in general, non-inhibitors of $3 \beta$-HSD and therefore would appear to be specific inhibitors of $17 \beta$-HSD3 (in the case of the 4-hydroxyketone based compounds) or 17ß-HSD1 (in the case of the biphenyl ketone based compounds). Due to the weak inhibitory activity of the compounds against $3 \beta$-HSD, no molecular modelling study was undertaken.

### 6.5 Conclusion

In conclusion, the series of potential inhibitors synthesised within the current study have proved to be, in general, specific and potent inhibitors of $17 \beta$ HSD1 and 17ß-HSD3 and were found to be non-inhibitors of $3 \beta-H S D$. As such, these compounds have proved to be good lead compounds in the further design and subsequent synthesis of novel and potent inhibitors of either 17ß-HSD1 (in the fight against hormone-dependent breast cancer) or $17 \beta$-HSD3 (in the fight against hormone-dependent prostate cancer).
